The Geometric Patterns of Perception

by Parker Emmerson

The idea of this paper is to explain how, when a wedge of arc length, t, is taken out of a circle and the circle is then put back together, keeping the initial radius as the slant of the newly formed cone, the height increases and the inital radius changes angle to the circular base, which has a new radius. The difference between the radii leads to a change in circumference for the circle of our system. That change can be considered a $D[C]\, d\theta$. The change is also then placed in terms of time. So, we have relationary time aspects fusing with axis at an infinite angle.

$C = 2\pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2\pi r_1$

This is the circumference of our second circle, the base of the cone, of radius r_1

$r^2 = r_1^2 + h^2$

This is the initial radius squared expressed as the slant of the cone in terms of the height of the cone, h, and the radius of the base of the cone, r_1

$r = \sqrt{(r_1^2 + h^2)}$

$t = \theta r$

$t / \theta = r$

$t = C - C_2 = 2\pi r - 2\pi r_1 = \theta r \quad \rightarrow$ Equation 7

$r_1^2 == r^2 - h^2$

$r_1 = \sqrt{(r^2 - h^2)}$

$h < r$

Solve[r_1^2 + h^2 == r^2, h]

$\left\{\left\{h \rightarrow -\sqrt{r^2 - r_1^2}\right\}, \left\{h \rightarrow \sqrt{r^2 - r_1^2}\right\}\right\}$

$\mathbf{t = C - C_2 = 2\pi r - 2\pi r_1}$

Put

$r_1 = \sqrt{(r^2 - h^2)}$

in for the equation of the base of the cone of Equation 7.

$t = C - C_2 =$

$2\pi r - 2\pi r_1 = 2\pi\,(t/\theta) - 2\pi\,\sqrt{((t/\theta)^2 - h^2)} = t$

$(t/\theta) = r$

$\left(2\pi\,(r) - 2\pi\,\sqrt{((r)^2 - h^2)}\right) = t$

Add $2\pi\,\sqrt{((r)^2 - h^2)}$ to both sides

$t + 2\pi\,\sqrt{((t/\theta)^2 - (h^2))} = 2\pi\,(t/\theta) = 2\pi r$

Subtract t from both sides

$2\pi\,\sqrt{((t/\theta)^2 - (h^2))} = 2\pi\,(t/\theta) - t = 2\pi r - t$

divide by 2π on both sides

$(t/\theta) - t/2\pi = \sqrt{((t/\theta)^2 - (h^2))} = r_1 = \sqrt{((r)^2 - (h^2))}$

$(t/\theta) - t/(2\pi)$

$$-\frac{t}{2\pi} + \frac{t}{\theta}$$

Square both sides

$((t/\theta) - (t/2\pi))^2 = ((t/\theta)^2 - (h^2)) = (r_1{}^2)$

add (h^2) to both sides

$(h^2) + ((t/\theta) - (t/2\pi))\,((t/\theta) - (t/2\pi)) = (t/\theta)^2 = r^2$

$((t/\theta) - (t/2\pi))^2$

$((r) - (\theta * r/2\pi))^2$

$$\left(r - \frac{\pi r \theta}{2}\right)^2$$

$$\left(-\frac{(\pi * r * \theta)}{2} + \frac{(r * \theta)}{\theta}\right)^2$$

$$\left(r - \frac{\pi r \theta}{2}\right)^2$$

Expand$\left[\left(r - \frac{\pi * r * \theta}{2}\right)^2\right]$

$$r^2 - \pi r^2 \theta + \frac{1}{4}\pi^2 r^2 \theta^2$$

Subtract $\left(-\frac{\pi\, r\theta}{2}+r\right)^2$ **from both sides**

(t / θ) ^2 - {(t / θ) - t / 2 π} {(t / θ) - t / 2 π} = (h^2)

(r^2 / θ^2) - {(r) - (θ * r) / 2 π} {((θ * r) / θ) - (θ * r) / 2 π}

Take the square root on both sides to find h

h = Sqrt[(t / θ) ^2 - {(t / θ) - t / 2 π} {(t / θ) - t / 2 π}] =
$\sqrt{(r)\,\hat{}\,2 - \{(r) - (\theta * r) / 2\pi\}\{(r) - (\theta * r) / 2\pi\}}$

(r) ^2 - {(r) - (θ * r) / 2 π} {(r) - (θ * r) / 2 π}

$$\left\{r^2 - \left(r - \frac{\pi\, r\, \theta}{2}\right)^2\right\}$$

$$\text{Simplify}\left[\sqrt{-\left(-\frac{\pi\, r * \theta}{2} + \frac{r * \theta}{\theta}\right)^2 + \frac{r\,\hat{}\,2 * \theta^2}{\theta^2}}\,\right]$$

$$\sqrt{r^2 - \left(r - \frac{\pi\, r\, \theta}{2}\right)^2}$$

$$\text{Simplify}\left[\sqrt{-\left(-\frac{\pi\, (r * \theta)}{2} + \frac{(r * \theta)}{\theta}\right)^2 + r\,\hat{}\,2}\,\right]$$

$$\sqrt{r^2 - \left(r - \frac{\pi\, r\, \theta}{2}\right)^2}$$

$$\text{Simplify}\left[\sqrt{-\left(-\frac{\pi\, (r\theta)}{2} + \frac{(r\theta)}{\theta}\right)^2 + r}\,\right]$$

$$\sqrt{r^2 - \left(-\frac{\pi\, r\theta}{2} + \frac{r\theta}{\theta}\right)^2}$$

Sqrt[(t / θ) ^2 - {(t / θ) - t / 2 π} {(t / θ) - t / 2 π}] =
Sqrt[((θr) / θ) ^2 - {(r) - (θr) / 2 π} ((r) - (θr) / 2 π)]

(((θr) / θ) ^2) = θ^2 r^2 / θ^2

r^2

Sqrt[((θr) / θ) ^2 - {(r) - (θr) / 2 π} ((r) - (θr) / 2 π)]

$$\sqrt{-\left(-\frac{\pi\, r\theta}{2} + \frac{r\theta}{\theta}\right)^2 + \frac{r\theta^2}{\theta^2}} = \left\{\sqrt{\frac{\theta r^2}{\theta^2} - \left(r - \frac{\pi\, \theta r}{2}\right)^2}\right\} = h$$

$$\text{Expand}\left[\left(r - \frac{\pi\,\theta * r}{2}\right)^2\right]$$

$$r^2 - \pi\, r^2\, \theta + \frac{1}{4}\pi^2\, r^2\, \theta^2$$

$$\text{Solve}\left[\left\{\sqrt{\frac{\theta r^2}{\theta^2} - \left(r - \frac{\pi\,\theta r}{2}\right)^2}\right\} == h,\ \{\theta\}\right]$$

$$h\,\hat{}\,2 = \frac{\theta r^2}{\theta^2} - \left(r - \frac{\pi\,\theta r}{2}\right)^2$$

$$r^2 - \pi\, r\, \theta r + \frac{\pi^2\,(\theta r)^2}{4} = r^2 - \pi\, r^2\, \theta + \frac{1}{4}\pi^2\, r^2\, \theta^2$$

$$\sqrt{r^2 - \left(r^2 - \pi\, r^2\, \theta + \frac{1}{4}\pi^2\, r^2\, \theta^2\right)}$$

$$\sqrt{\pi\, r^2\, \theta - \frac{1}{4}\pi^2\, r^2\, \theta^2}$$

$$\sqrt{\pi\, r^2\, \theta - \frac{1}{4}\pi^2\, r^2\, \theta^2} = h$$

Square both sides

$$\pi\, r^2\, \theta - \frac{1}{4}\pi^2\, r^2\, \theta^2 = (h\,\hat{}\,2)$$

Divide by r^2 on both sides

$$\left(\pi\, r^2\, \theta - \frac{1}{4}\pi^2\, r^2\, \theta^2\right) \Big/ (r\,\hat{}\,2) = \left((h\,\hat{}\,2) \,/\, r^2\right)$$

$$\left(\pi\ \theta - \frac{1}{4}\pi^2\ \theta^2\right) = \left((h\,\hat{}\,2) \,/\, r^2\right)$$

$$(h\,\hat{}\,2) \Big/ \left(\pi\ \theta - \frac{1}{4}\pi^2\ \theta^2\right) = r^2$$

$$h = c3\theta$$

$$(((3.0 * 10\,\hat{}\,8) * 3 * \theta)\,\hat{}\,2) \Big/ \left(\pi\ \theta - \frac{1}{4}\pi^2\ \theta^2\right) = r^2$$

$$r^2$$

$$\left((h\,\hat{}\,2) \,/\, r^2\right) = x$$

Multiply by r ^ 2; Divide by $\left(1-(\pi*\theta)+\frac{1}{4}\left(\pi^2*\theta^2\right)\right)$ on both sides

EQUATION ⌗ X .1

$$(h^2) \Big/ \left(\pi*\Theta-\frac{1}{4}\left(\pi^2*\Theta^2\right)\right) = r^2$$

set r^2 = (1 + 3 + 5 ... (2 n - 1))

$$(1+3+5\ldots(2n-1)) = (h^2) \Big/ \left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)$$

For n = 1

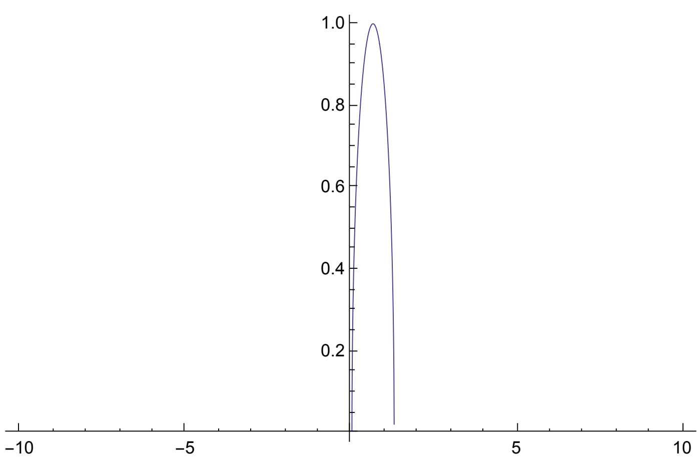
$$1 = \left((h^2) \Big/ \left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)\right),$$

so

$$\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right) = (h^2)$$

$$\sqrt{\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)} = h$$

Plot$\left[\sqrt{\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}, \{\theta, -10, 10\}\right]$



Solve$\left[\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right) == 0, \{\theta\}\right]$

$$\left\{\{\Theta\to 0\}, \left\{\Theta\to\frac{4}{\pi}\right\}\right\}$$

For n = 2;

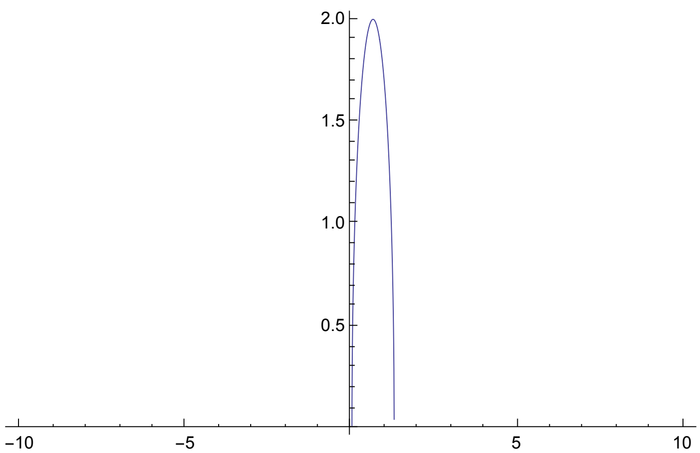
$$(1+(2n-1)) = 4 = \left((h^2) \Big/ \left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)\right)$$

So, multiplying on both sides,

$$4\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right) = (h \wedge 2)$$

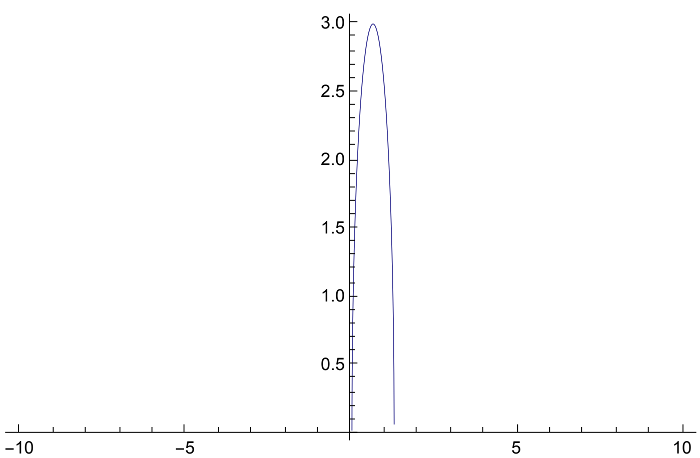
$$\sqrt{4\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)} = h$$

$$\text{Plot}\left[\sqrt{4\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)}, \{\theta, -10, 10\}\right]$$



For n = 3

$$\text{Plot}\left[\sqrt{9\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)}, \{\theta, -10, 10\}\right]$$



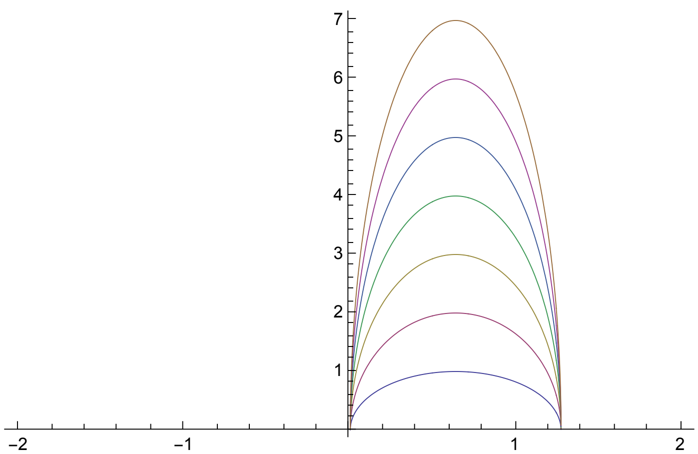
For n = 4; $\sqrt{16\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)} = h$

For n = 5; $\sqrt{25\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}=h$

For n = 6; $\sqrt{36\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}=h$

For n = 7; $\sqrt{49\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}=h$

$$\text{Plot}\left[\left\{\sqrt{\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{4\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{9\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{16\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{25\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{36\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{49\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}\right\},\ \{\theta,-2,2\}\right]$$



We have plotted what will happen to the height as theta changes. Next we want to know r_1 and its change with theta if r is the series r ^ 2 = (1 + 3 + ... (2 n - 1))

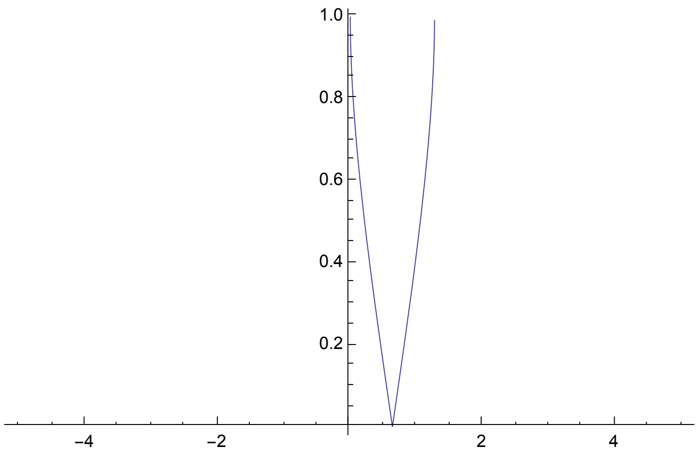
Some have noted the phalas and some have noted that the mind is sometimes thought of as the head.

Remember, $r_1=\sqrt{((t/\theta)\hat{}2-(h\hat{}2))}=r_1=\sqrt{(r\hat{}2-h\hat{}2)}$

For n = 1;

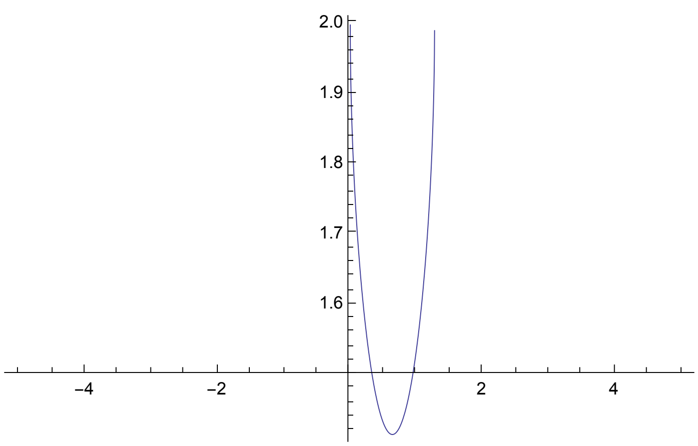
$$r_1 = \sqrt{(r\wedge 2 - h\wedge 2)} = \sqrt{\left(1 - \sqrt{\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)}\right)}$$

$$\text{Plot}\left[\sqrt{\left(1 - \sqrt{\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)}\right)}, \{\theta, -5, 5\}\right]$$



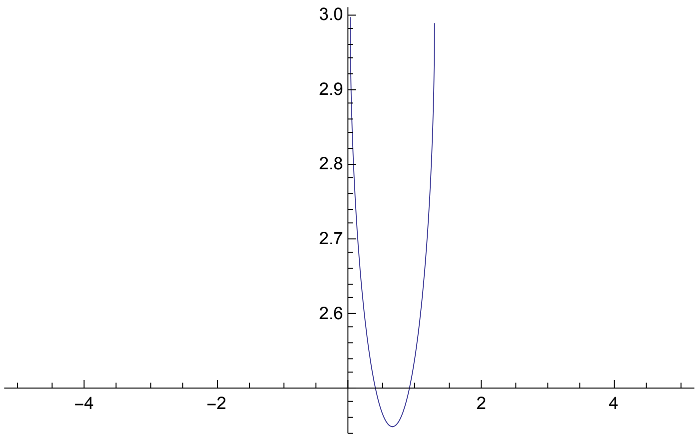
For n = 2

$$\text{Plot}\left[\sqrt{4 - \sqrt{4\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)}}, \{\theta, -5, 5\}\right]$$



For n = 3;

$$\text{Plot}\left[\sqrt{9-\sqrt{9\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}},\ \{\theta,-5,5\}\right]$$



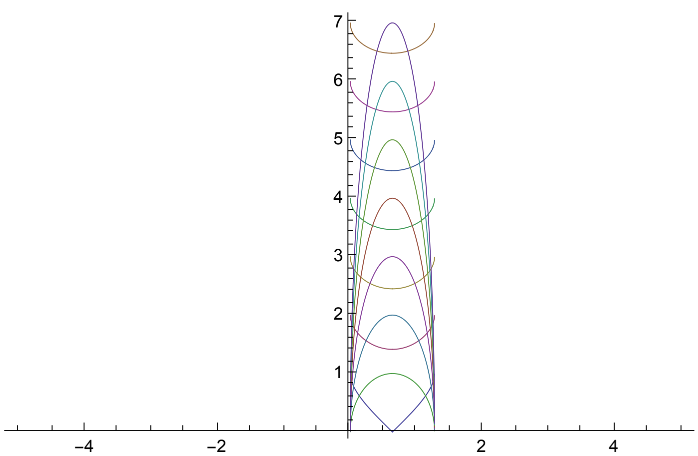
$$n=4;\ r_1=\sqrt{16-\sqrt{16\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}}$$

$$n=5;\ r_1=\sqrt{25-\sqrt{25\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}}$$

$$n=6;\ r_1=\sqrt{36-\sqrt{36\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}}$$

$$n=7;\ r_1=\sqrt{49-\sqrt{49\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}}$$

$$\text{Plot}\Big[\Big\{\sqrt{\left(1-\sqrt{\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}\right)},\ \sqrt{4-\sqrt{4\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}},$$
$$\sqrt{9-\sqrt{9\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}},\ \sqrt{16-\sqrt{16\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}},$$
$$\sqrt{25-\sqrt{25\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}},\ \sqrt{36-\sqrt{36\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}},$$
$$\sqrt{49-\sqrt{49\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}},\ \sqrt{\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},$$
$$\sqrt{4\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{9\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{16\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},$$
$$\sqrt{25\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{36\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)},\ \sqrt{49\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)}\Big\},$$
$$\{\theta, -5, 5\}\Big]$$



Though please note the pointed place at
which the bottom most chalace intersects the x axis.

```
Plot[{Sqrt[(1 - Sqrt[(π*θ - 1/4 (π^2*θ^2))])], Sqrt[4 - Sqrt[4 (π*θ - 1/4 (π^2*θ^2))]],
  Sqrt[9 - Sqrt[9 (π*θ - 1/4 (π^2*θ^2))]], Sqrt[16 - Sqrt[16 (π*θ - 1/4 (π^2*θ^2))]],
  Sqrt[25 - Sqrt[25 (π*θ - 1/4 (π^2*θ^2))]], Sqrt[36 - Sqrt[36 (π*θ - 1/4 (π^2*θ^2))]],
  Sqrt[49 - Sqrt[49 (π*θ - 1/4 (π^2*θ^2))]]}, {θ, -10, 10}]
```

$C = 2\pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2\pi r_1$

This is the circumference of our second circle,
the base of the cone, of radius r_1

So, we integrate the circumference, to get a certain area,
due to a representationality in the virtual world.

In our last discovery, we found out that the height of the cone is a function of the angle and the radius. Here, we will try to eliminate one of the variables, and we can do this, because it is the same variable as time when given a constant velocity, say of light going toward your eye. We will try to see about the concept of negative time and philosophically discuss its objective meaning. We begin by consulting Figure x.

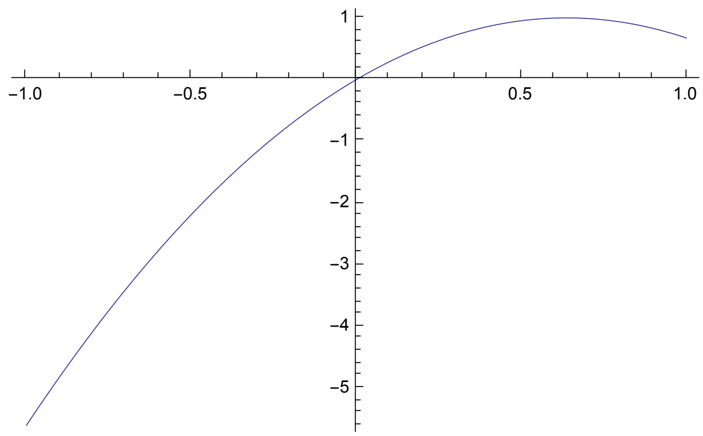
from equations of a cone, we know that

$$(h^2) \Big/ \left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right) = r^2$$

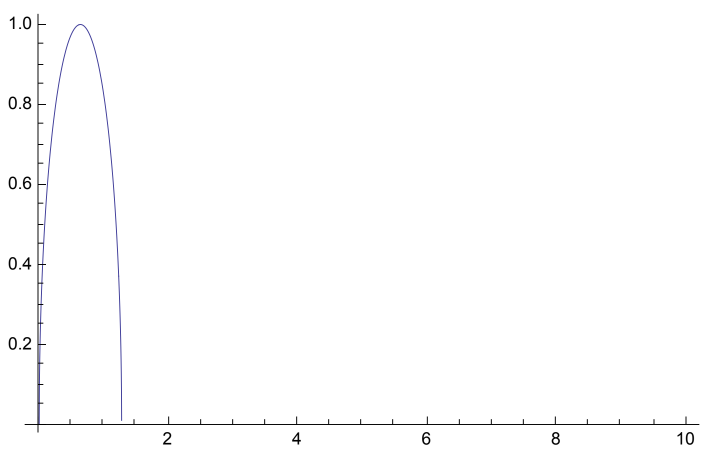
Thus, we can also say that for r^2=1, because n=1; that,

$$\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right) = (h^2) \Big/ r^2 = X^2$$

```
Plot[(π * θ - 1/4 (π^2 * θ^2)), {θ, -1, 1}]
```



```
Plot[Sqrt[(π * θ - 1/4 (π^2 * θ^2))], {θ, 0, 10}]
```



Suppose that the height of the cone is transforming at the speed of light, moving up to its highest length. We see that it then comes back down, through the passage of time or angle. We can then plot purely the radius and angle measure, without the height as an inexpressible entitiy in terms of the other variables we are relating, because of the constant speed of light acting to describe the height in terms of travel through space - time. That which can be measured by the folding of the circle into a cone relates to the amount of the circle you take out from the time then to the time now. We then get the below equation

To come up with this equation, we say that h = c*t = c*f(θ)

so, we also then say that, from

EQUATION ⌗ X .1

$$(h^2)\Big/\left(\pi*\Theta-\frac{1}{4}\left(\pi^2*\Theta^2\right)\right)=r^2$$

$$\left(\pi*\theta-\frac{1}{4}\left(\pi^2*\theta^2\right)\right)=(h^2)\big/r^2=X^2;$$

$$r^2\left(\pi*f[\theta]-\frac{1}{4}\left(\pi^2*f[\theta]^2\right)\right)=(h^2)=c^2*t^2$$

30 sec = π "time"

so, for our time equality to work with the angle change, we are going to have to relate 360 degrees = 60 seconds = 2 π rad. That means to go from seconds to angles, we multiply a theta given in radians by 180/π in order to go to degrees, and then convert to those degrees to seconds by multiplying by (1/6 deg.), because 60 seconds=360 degrees.

So, this means that we can say that time is equal to the amount of the circle' s angularity/arc length that we remove from the initial circle has a unit of time.

from time----->angle measure, we multiply by

From the equation
ct = c * (f[θ])

S.T.

θ is in degrees, and to go to time, we would convert

θdeg. (π rad. / 180 deg.), and from radians,
we say that thirty seconds go by every pi radians., so to cancel the radians,
we say every 30 seconds, we cover pi radians of distance. Thus,
the final conversion fom degrees to minutes runs :
θ deg. * (π rad. / 180 deg.) (60 sec / π rad.) = t

Our multiplier then is just 1 sec. / 3 deg. to go to seconds.
and we recently found that :

[(h^2) / (πr^2)] = (θ - 1 / 4 π (θ^2))

Thus, also we may say that it takes 3 deg. / sec. if we are given a time

$$c^2 * t^2 = r^2 \left(\pi * \theta - \frac{1}{4} \left(\pi^2 * \theta^2\right)\right) = c^2 * (1/3)\ \theta^2$$

$$c^2 * \left((3\ \theta)^2 \Big/ \left(\pi * \theta - \frac{1}{4} \left(\pi^2 * \theta^2\right)\right)\right) = r^2$$

$$r = \sqrt{c^2 * \left((3\ \theta)^2 \Big/ \left(\pi * \theta - \frac{1}{4} \left(\pi^2 * \theta^2\right)\right)\right)}$$

60 / 180

$$\frac{1}{3}$$

EQUATION ⌗ X .1

$$(h^2) \Big/ \left(\pi * \Theta - \frac{1}{4} \left(\pi^2 * \Theta^2\right)\right) = r^2$$

So, if we are given an angle, the generalized forms would look like this :

$$\left(c^2 * (((1/3)\ \Theta)^2) \Big/ \left(\pi * \Theta - \frac{1}{4} \left(\pi^2 * \Theta^2\right)\right)\right) = r^2$$

What happens when we factor the equation

$$\sqrt{(3.0 * 10^8)^2 * \left(((t)^2) \Big/ \left(\pi * \theta - \frac{1}{4} \left(\pi^2 * \theta^2\right)\right)\right)}$$

$$\text{Factor}\left[\sqrt{\left((3.0 * 10^8)^2 * (((1/3)\ \theta)^2) \Big/ \left(\pi * \theta - \frac{1}{4} \left(\pi^2 * \theta^2\right)\right)\right)}\right]$$

$$1.12838 \times 10^8 \sqrt{-\frac{\Theta}{-4 + \pi\ \Theta}}$$

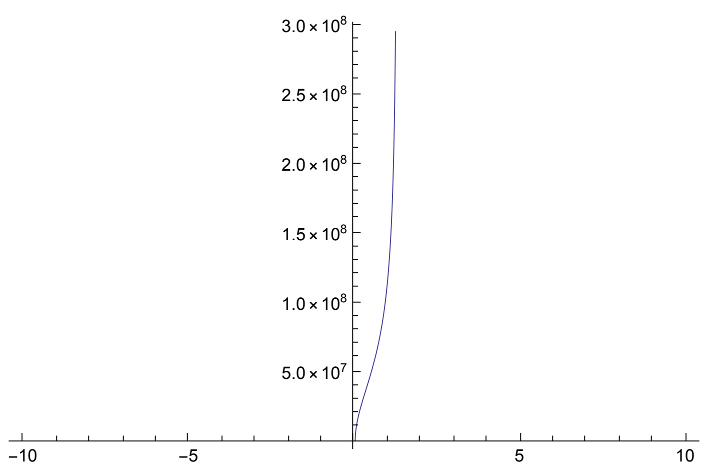
```
√(((3.0 * 10^8)^2 * ((t)^2) / (π * (θ / 3) - 1/4 (π^2 * (θ / 3)^2))))
```

$$3.\times 10^{8}\sqrt{\frac{t^{2}}{\frac{\pi\,\theta}{3}-\frac{\pi^{2}\,\theta^{2}}{36}}}$$

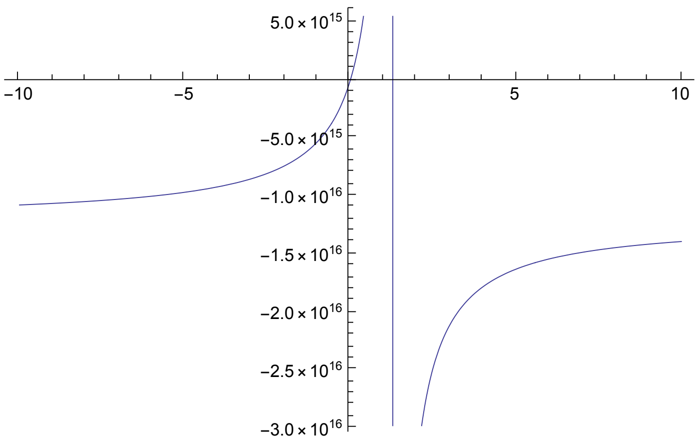
An imaginary solution.

Then we' ll plot our time in terms of theta when solved for r.

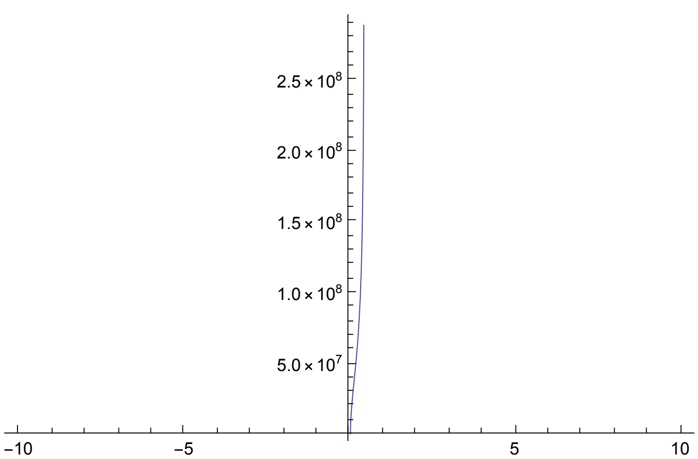
```
Plot[√(((3.0 * 10^8)^2 * (((1/3) θ)^2) / (π * θ - 1/4 (π^2 * θ^2)))), {θ, -10, 10}]
```



```
Plot[((3.0*10^8)^2*((t)^2)/(π*3 t - 1/4 (π^2*3 t^2))), {t, -10, 10}]
```



```
Plot[Sqrt[((3.0*10^8)^2*(((t)^2)/(π*3 t - 1/4 (π^2*(3 t)^2))))], {t, -10, 10}]
```



where c is the speed of light and 3 * t = the angle we have taken out of the circle,
when keeping the initial radius of the circle as the slant of the new cone,
and our new radius of the base of the cone is determined

$$(\texttt{c}^{\wedge}2) = \left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right) \texttt{r}^{\wedge}2 \,/\, (((1/3)\ \theta)^{\wedge}2)$$

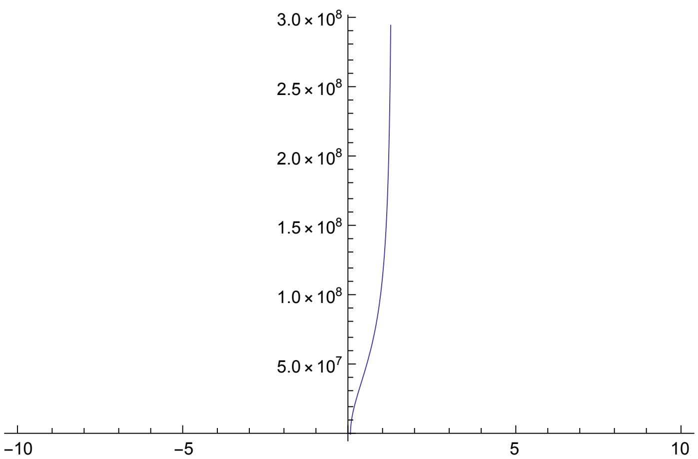
$$(\texttt{c}^{\wedge}2)\,/\,\texttt{r}^{\wedge}2 = \left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right) \Big/ \ (((1/3)\ \theta)^{\wedge}2)$$

$$\texttt{Solve}\left[\left((3.0 * 10^{\wedge}8)^{\wedge}2 * \left((3\ \theta)^{\wedge}2 \Big/ \left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)\right)\right) == \texttt{r},\ \theta\right]$$

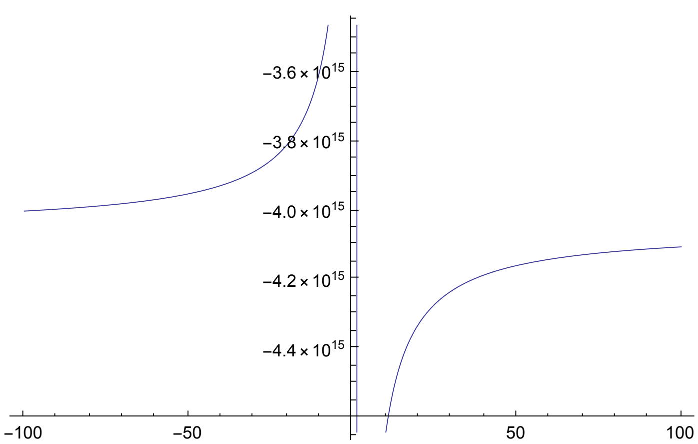
$$\left\{\left\{\theta \to \frac{12.5664\ \texttt{r}}{3.24 \times 10^{18} + 9.8696\ \texttt{r}}\right\}\right\}$$

$$\left\{\left\{\theta \to \left(\frac{12.566370614359172\grave{}\ \texttt{r}}{3.24\grave{}*^{\wedge}18 + 9.869604401089358\grave{}\ \texttt{r}}\right)\right\}\right\}$$

$$\texttt{Plot}\left[\sqrt{((3.0 * 10^{\wedge}8)^{\wedge}2) \Big/ \left(\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right) \Big/ \ (((1/3)\ \theta)^{\wedge}2)\right)},\ \{\theta, -10, 10\}\right]$$



$$\texttt{Plot}\left[((3.0 * 10^{\wedge}8)^{\wedge}2) \Big/ \left(\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right) \Big/ \ (((1/3)\ \theta)^{\wedge}2)\right),\ \{\theta, -100, 100\}\right]$$



But to now place θ in terms of r, we see a new plot

$$3\left(\frac{\pi}{\frac{\pi}{4}+\frac{9.\times 10^{12}}{r^2}}\right) = t$$

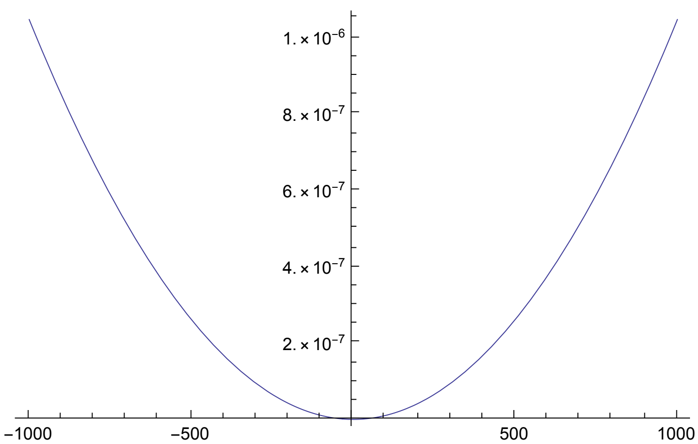
$$\text{Factor}\left[3\left(\frac{\pi}{\frac{\pi}{4}+\frac{9.`*\text{^}12}{r^2}}\right)\right]$$

$$\frac{37.6991\, r^2}{3.6\times 10^{13}+3.14159\, r^2}$$

$$\text{Simplify}\left[3\left(\frac{\pi}{\frac{\pi}{4}+\frac{9.`*\text{^}12}{r^2}}\right)\right]$$

$$\frac{9.42478\, r^2}{9.\times 10^{12}+0.785398\, r^2}$$

$$\text{Plot}\left[3\left(\frac{\pi}{\frac{\pi}{4}+\frac{9.`*\text{^}12}{r^2}}\right), \{r, -1000, 1000\}\right]$$



$$\frac{\pi}{\frac{\pi}{4}+\frac{9.`*\text{^}12}{r^2}} = \theta = dt = \text{change in time}$$

$$\theta\left(\frac{\pi}{4}+\frac{9.`*\text{^}12}{r^2}\right) = \pi$$

$$\theta\,\frac{9.`*\text{^}12}{r^2} = \pi - \theta\,\frac{\pi}{4}$$

$$r^2 = \theta\,(9.`*\text{^}12)/\pi - \theta\,\frac{\pi}{4}$$

$$\sqrt{\theta\,(9.`*\text{^}12)/\pi - \theta\,\frac{\pi}{4}} = r$$

For n = 1;

$\theta * (9.`*^{\wedge}12) \Big/ \left(\pi - \theta * \frac{\pi}{4}\right) = r = 1;$

Thus, $\left(\pi - \theta * \frac{\pi}{4}\right) = \theta * (9.`*^{\wedge}12);$

and,

$\pi \Big/ \left((9.`*^{\wedge}12) + \frac{\pi}{4}\right) = \theta o\ = o.a\,k\pi = \theta \left(\frac{\pi}{4} + \frac{9.`*^{\wedge}12}{r^2}\right);$

$\pi = \theta * \frac{\pi}{4} + \theta * \frac{9.`*^{\wedge}12}{r^2};$

$\pi - \theta * \frac{\pi}{4} = \theta * \frac{9.`*^{\wedge}12}{r^2};$

$r^2 \left(\pi - \theta * \frac{\pi}{4}\right) = \theta * (9.`*^{\wedge}12);$

$\theta * (9.`*^{\wedge}12) \Big/ \left(\pi - \theta * \frac{\pi}{4}\right) = r^2;$

$\sqrt{\left\{\theta * (9.`*^{\wedge}12) \Big/ \left(\pi - \theta * \frac{\pi}{4}\right)\right\}} = r\backslash$

$\text{Solve}\left[\left(c^{\wedge}2 * (((1/3)\,\theta)^{\wedge}2) \Big/ \left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)\right) == r^{\wedge}2, \theta\right]$

$\left\{\left\{\theta \to \frac{36\,\pi\,r^2}{4\,c^2 + 9\,\pi^2\,r^2}\right\}\right\}$

$N\left[\pi \Big/ \left((9.`*^{\wedge}12) + \frac{\pi}{4}\right)\right]$

3.49066×10^{-13}

$\text{Solve}\left[\sqrt{\left\{\theta * (9.`*^{\wedge}12) \Big/ \left(\pi - \theta * \frac{\pi}{4}\right)\right\}} == r, \theta\right]$

Solve::eqf : $\left\{3.\times 10^{6}\ \sqrt{\frac{\theta}{\pi+\text{Times}[\ll 3\gg]}}\right\} == r$ is not a well−formed equation. ≫

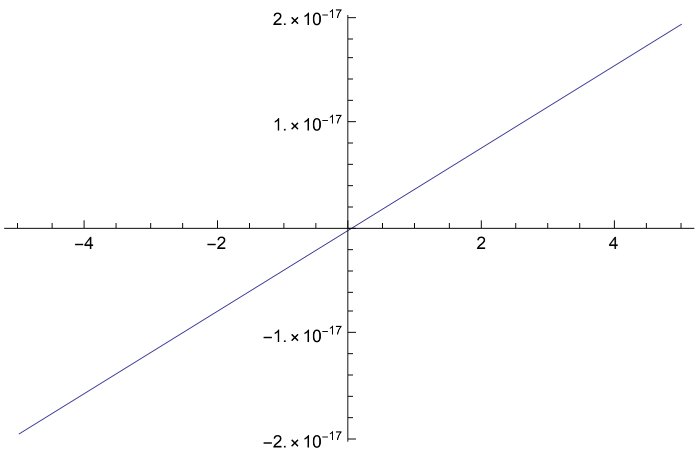
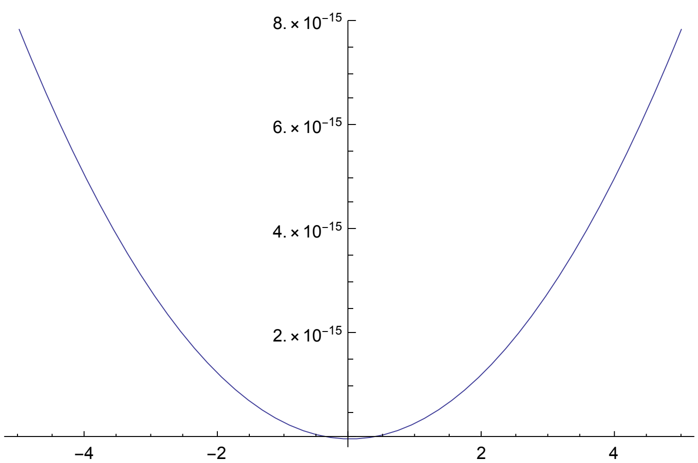
$$\text{Solve}\left[\left\{3.\times 10^{6}\ \sqrt{\frac{\Theta}{\pi-\frac{\pi\,\Theta}{4}}}\right\} == r,\ \Theta\right]$$

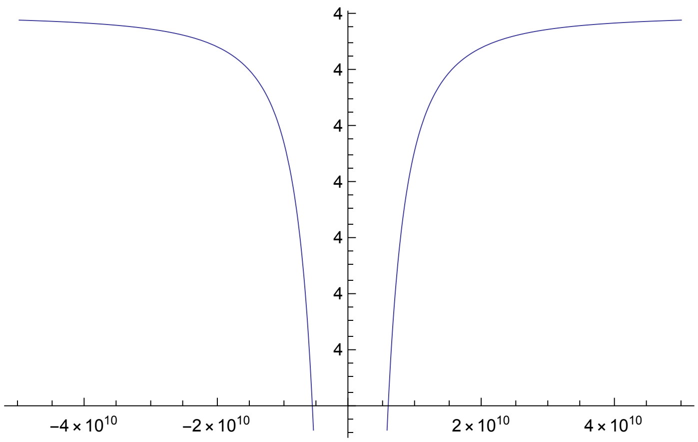
$$\text{Plot}\left[\frac{12.566370614359172\grave{}\ r}{3.24\grave{}*\wedge 18+9.869604401089358\grave{}\ r},\ \{r,-5,5\}\right]$$



$$\text{Plot}\left[\frac{36\,\pi\,r^{2}}{4\,(3.0*10\wedge 8)^{2}+9\,\pi^{2}\,r^{2}},\ \{r,-5,5\}\right]$$

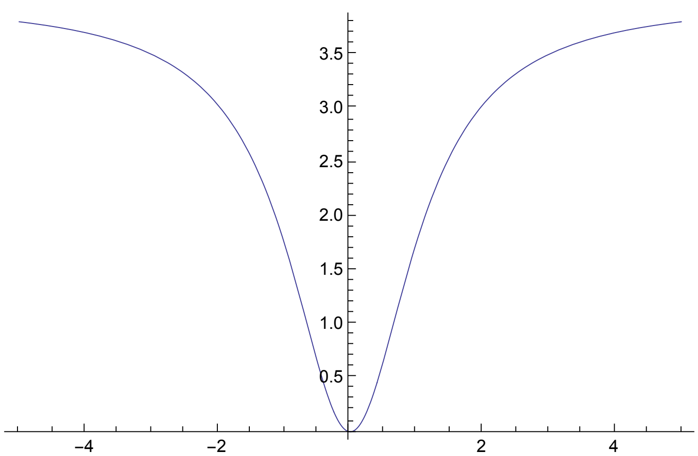


```
Plot[π/(π/4 + 9.`*^12/r^2), {r, -50 000 000 000, 50 000 000 000}]
```

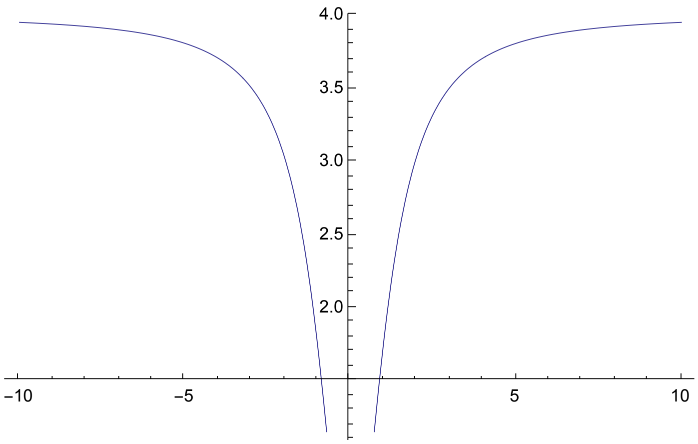


```
This plot maps what forever looks like.
```

```
Plot[π/(π/4 + 1/r^2), {r, -5, 5}]
```



$$\text{Plot}\left[\frac{\pi}{\frac{\pi}{4}+\frac{1}{r^2}}, \{r, -10, 10\}\right]$$

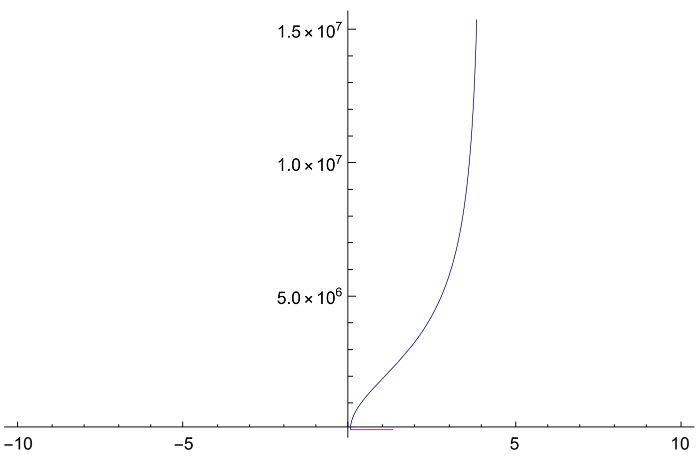


This is one forever within the four forevers. Does it really matter what part of forever time I take out of the circle to make my circle? no, not really, all time is all circle at the same time. We start from where the measurement begins.

This is a plot for fun, and interest.

$$\text{Plot}\left[\left\{\sqrt{\left\{\theta * (9.\grave{} *\char`^12) \Big/ \left(\pi - \theta * \frac{\pi}{4}\right)\right\}}, \sqrt{\left(1 - \sqrt{\left(\pi * \theta - \frac{1}{4}\left(\pi^2 * \theta^2\right)\right)}\right)}\right\}, \{\theta, -10, 10\}\right]$$

Goes all the way probably up to 2π, but that is just my guess.



Thus, we show that we must combine the plot for r when n = 1 and the plot for r when the speed of light is plugged into the distance for r = h. Only when we do this, do we even see anything close to 2π.

However, if we want to make sure that our units are correct,
we will create a new change of variables by converting units.

$$\frac{\pi}{\frac{\pi}{4}+\frac{9.\grave{}*\hat{}12}{r^2}} = \theta = \mathrm{dt} = \text{change in time}$$

Converting theta into a change in time requires some thought,
and also the multiplier $(\pi / 3)$.

Speculation : Dark matter is present due to the incorrect integrations of the circle when compared with the luminosity of a change in height of the cone or the distance of an event to the subject.

CONCLUSION

$$\mathrm{Plot}\left[\frac{\pi}{\frac{\pi}{4}+\frac{9.\grave{}*\hat{}12}{\left(\sqrt{(((3.0*10\hat{}8)*3*\theta)\hat{}2)\Big/\left(\pi\,\theta-\frac{1}{4}\pi^2\,\theta^2\right)}\right)^2}}, \{\theta, -. = , .0005\}\,\right]$$

No Time, only True

The time variable has helped us so far, but now, we see that there is

only something called true. See the Paper by Parker Emmerson and Andrew Berisha on Unified Theory for an explanation of the origin of the equations used below.

by Parker Emmerson and Andrew Berisha

$$\text{Solve}\Big[v == \frac{\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}\ (-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3)}{(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4)^{3/2}} - \frac{\sqrt{\pi}\ (4\pi-2\theta)}{\sqrt{4\pi\theta-\theta^2}\ \sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}},\ \theta\Big] \tag{228}$$

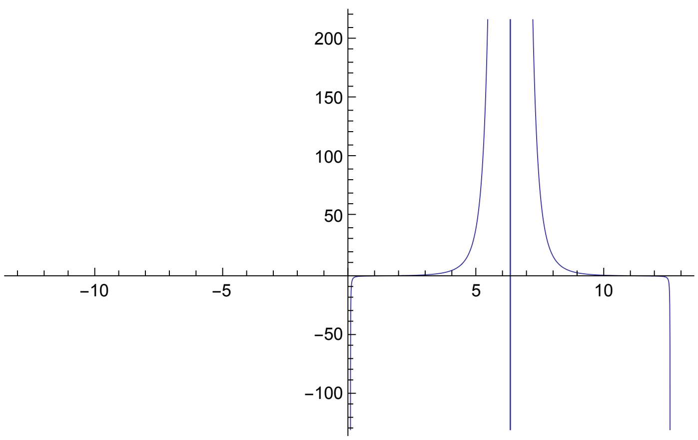
In terms of true, there is no assymptote at 2 π.

$$\text{Plot}\Big[\frac{3\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}\ \left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)^2}{2\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{5/2}}-\frac{\sqrt{\pi}\ \sqrt{4\pi\theta-\theta^2}\ \left(48\pi^2-48\pi\theta+12\theta^2\right)}{\left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}}-\frac{\sqrt{\pi}\ (4\pi-2\theta)\ \left(-32\pi^3+48\pi^2\theta-24\pi\theta^2+4\theta^3\right)}{\sqrt{4\pi\theta-\theta^2}\ \left(16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4\right)^{3/2}}-\frac{\sqrt{\pi}\ (4\pi-2\theta)^2}{2\left(4\pi\theta-\theta^2\right)^{3/2}\sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}}-\frac{2\sqrt{\pi}}{\sqrt{4\pi\theta-\theta^2}\ \sqrt{16\pi^4-32\pi^3\theta+24\pi^2\theta^2-8\pi\theta^3+\theta^4}},\ \{\theta,-13,13\}\Big]$$



For terms of time, there is an assymptote at 2 π.

THIS MEANS THAT THERE IS NO SUCH THING AS TIME, THERE IS ONLY TRUE! And the truth is that the rest of the equations plot emptiness. This is the only one that gives us a graph.

There are only trues,
and time is the inverse of true. Time is false, time is illusion (232)

Disprove Nietze multiply by 0, but keep everything solid

Three Principles of Acceleration in a Space Defined by Light

by Parker Matthew Davis Emmerson

©Parker Emmerson October 11, 2009

The parameters of a cone through an expression relating a difference in circumferences to an arc length of the initial position. Please note that while this goes on in the unit circle, certain things are going on in the complex sphere.

$C = 2\pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2\pi r_1$

This is the circumference of our second circle,

the base of the cone, of radius r_1

$r^2 = r_1^2 + \eta^2$

This is the initial radius squared expressed as the slant of the cone in terms of the height of the cone, η, and the radius of the base of the cone, r_1

$r = \sqrt{(r_1^2 + \eta^2)}$

$s = \theta r$

$s / \theta = r$

The arc length taken out of a circle at a given time is =

$t = C - C_2 = 2\pi r - 2\pi r_1 = \theta r \quad \rightarrow$ Equation 7

$r_1^2 == r^2 - \eta^2$

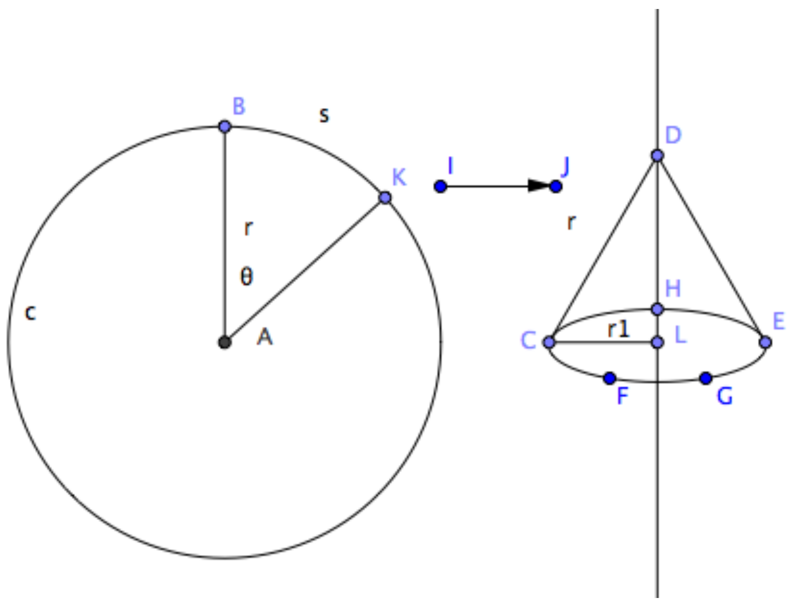
$r_1 = \sqrt{(r^2 - \eta^2)}$

$\eta \leq r$

$\tau =$ time

1 second = 6 degrees

$\tau = 6\,(180/\pi)\,\theta$



I will now do some algebra to conclude what the height of the cone is in terms of the initial parameters. It can eventually be reduced to a single variable.

II. Proof

Solve[r_1^2 + η^2 == r^2, η]

$$\left\{\left\{\eta \to -\sqrt{r^2 - r_1^2}\right\}, \left\{\eta \to \sqrt{r^2 - r_1^2}\right\}\right\} \tag{234}$$

We say that the amount of $\theta r =$ s, taken out of the circle is the change in the circle's circumference that is the base of the cone. The change is equal to $s = 2\pi r - 2\pi r_1$.

Notice that $\theta =$ $((2\pi r)/r) - ((2\pi r_1)/r)$, because we divide by r on both sides.

We will focus on the positive solutions for the height of the cone.

$\text{Solve}\left[\eta == \sqrt{r^2 - r_1^2}, r_1\right]$

$$\left\{\left\{r_1 \to -\sqrt{r^2 - \eta^2}\right\}, \left\{r_1 \to \sqrt{r^2 - \eta^2}\right\}\right\} \quad (235)$$

This is the change in circumference with the substituted expression for r_1 in terms of h and r.

$$r\,\theta == s == 2\pi\,(r) - 2\pi\sqrt{((r)\wedge 2 - \eta\wedge 2)} = 2\pi\,(r) - 2\pi\,r_1 \quad (236)$$

$\theta == (2\pi r)/r - (2\pi r\ _1)/r) = ((2\pi r)/r) - \left(\left(2\pi\sqrt{-\eta^2 + r^2}\right)\Big/ r\right)\Big)$

$\text{Solve}\left[\theta * r == 2\pi\,(r) - 2\pi\sqrt{((r)\wedge 2 - \eta\wedge 2)}, \eta\right]$

$$\left\{\left\{\eta \to -\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\right\}\right\}$$

$\text{Solve}\left[\eta == \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, r\right]$

$$\left\{\left\{r \to -\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}, \left\{r \to \frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}\right\}$$

In polar coordinates, it can be said that $r_1 = r\,\text{Cos}[\theta]$, and that $\eta = r\,\text{Sin}[\theta]$ (237)

$$\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}} = r = \frac{2\pi * r * \text{Sin}[\theta]}{\sqrt{4\pi\theta - \theta^2}} \quad (238)$$

c := (2.99792458 * 10^8)

$$\eta := \text{rate} * \text{time} = c * \tau = \text{height of cone} \quad (239)$$

$\tau := 6\left(\theta_{\text{degrees}}\right) = 6\,((180/\pi)\,\theta)$, because if theta were in radians to begin with, we would have to convert that number of radians to degrees. This way,
both our thetas are in radians,
but our result accounts for the constant of the degrees involved in measuring time.

(180 / π)

$$r = \frac{2 * c * \tau * \pi}{\sqrt{4\pi\theta - \theta)^2}} = \frac{2 * c * 6\,((180/\pi)\,\theta) * \pi}{\sqrt{4\pi\theta - (\theta)^2}}$$

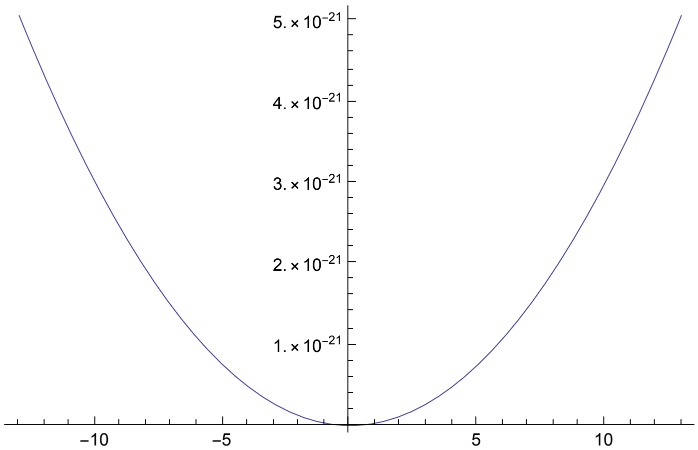
$\text{Solve}\left[r == \frac{2 * c * 6\,((180/\pi)\,\theta) * \pi}{\sqrt{4\pi\theta - (\theta)^2}}, \theta\right]$

$$\left\{\left\{\theta \to \frac{4\pi r^2}{4\,665\,600\,c^2 + r^2}\right\}\right\}$$

$$\text{Solve}\left[r == \frac{2 * c * 6\,((180/\pi)\,\theta) * \pi}{\sqrt{4\pi\theta - (\theta)^2}}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{4\pi r^2}{4\,665\,600\,c^2 + r^2}\right\}\right\}$$

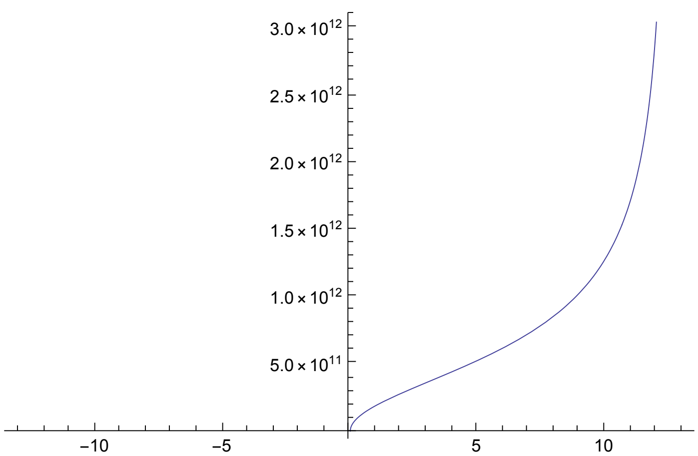
$$\text{Plot}\left[\frac{4\pi r^2}{4\,665\,600\,c^2 + r^2}, \{r, -13, 13\}\right]$$



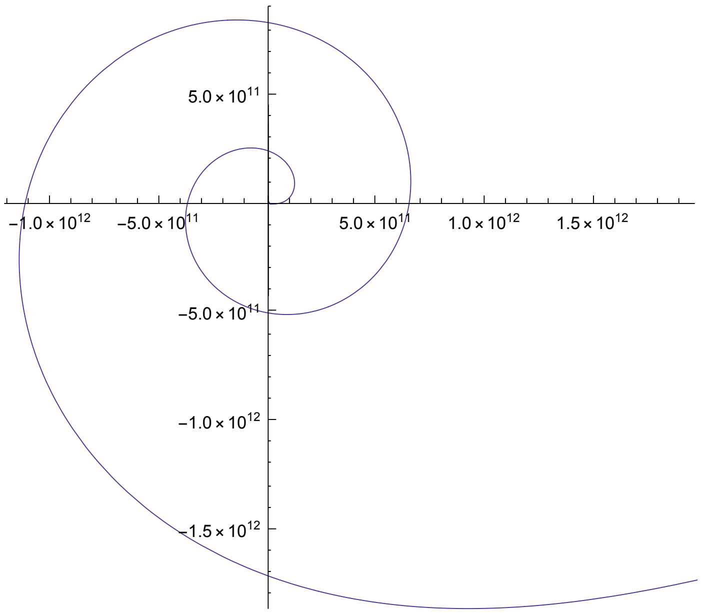
$$\text{Solve}\left[\theta == \frac{4\pi r^2}{4\,665\,600\,c^2 + r^2}, r\right]$$

$$\left\{\left\{r \to -\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\pi - \theta}}\right\}, \left\{r \to \frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\pi - \theta}}\right\}\right\}$$

$$\text{Plot}\left[\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\pi - \theta}}, \{\theta, -13, 13\}\right]$$



$$\text{PolarPlot}\left[\frac{2160\, c\, \sqrt{\theta}}{\sqrt{4\,\pi - \theta}}, \{\theta, -13, 13\}\right]$$



$$r := \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}};\ \eta = r\,\text{Sin}[\theta]$$

$$\frac{2160\, c\, \sqrt{\theta}}{\sqrt{4\,\pi - \theta}} = \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}} = \frac{2\,\pi\, r\,\text{Sin}[\theta]}{\sqrt{4\,\pi\,\theta - \theta^2}}$$

$$\text{Solve}\left[\frac{2160\, c\, \sqrt{\theta}}{\sqrt{4\,\pi - \theta}} == \frac{2\,\pi\, r\,\text{Sin}[\theta]}{\sqrt{4\,\pi\,\theta - \theta^2}}, r\right]$$

$$\left\{\left\{r \to \frac{1080\, c\, \sqrt{\theta}\, \sqrt{(4\,\pi - \theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi - \theta}}\right\}\right\}$$

III. Why define the space by light? I can' t travel faster than space.

We define the distance, η in terms of the speed of light, but also in terms of its pythagorean correlates. Since the space is a distance described by the speed of light, it is not absurd to think that something can accelerate within this space without going faster than the speed of light.

I. The First Principle, η:

$$\eta == \frac{\sqrt{4\,\pi\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi} =$$

$$\frac{\sqrt{4\,\pi\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi} =$$

$$\frac{\sqrt{4\,\pi\left(\frac{2\,\pi\,r\,\text{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta-\left(\frac{2\,\pi\,r\,\text{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta^2}}{2\,\pi} = r\,\text{Sin}[\beta]$$

The expressions for radius in terms of true Pythogorean proofs :

η := r Sin[θ] = r Sin[β] is the special case.

II. The Second Principle, r :

$$r := \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta-\theta^2}}$$

$$r = \frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}} = \frac{2\,\pi\,r\,\text{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}} = \frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}$$

$$\left(\text{Solve}\left[\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}} == \frac{2\,\pi\,r\,\text{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}},\ r\right]\right)$$

$$\left\{\left\{r \to \frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right\}\right\}$$

The radius, r_1, which is the base of a cone, with slant r and height η.

III. The Third Principle, r_1

$$\left\{\left\{r_1 \to -\sqrt{r^2-\eta^2}\right\},\ \left\{r_1 \to \sqrt{r^2-\eta^2}\right\}\right\}$$

$$\sqrt{r^2-\eta^2} = \sqrt{\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2 - \left(\frac{\sqrt{4\,\pi\,\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta - \left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi}\right)^2} =$$

$$\sqrt{\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2 - \left(\frac{\sqrt{4\,\pi\,\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta - \left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi}\right)^2} =$$

$$\sqrt{\left(\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2 - \left(\frac{\sqrt{4\,\pi\,\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta - \left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi}\right)^2\right)} =$$

$$\sqrt{\left(\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2 - \left(\frac{\sqrt{4\,\pi\,\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta - \left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi}\right)^2\right)} =$$

$$\sqrt{\left(\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2 - \left(\frac{\sqrt{4\,\pi\,\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta - \left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi}\right)^2\right)} =$$

$$\sqrt{\left(\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2 - \left(\frac{\sqrt{4\,\pi\,\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\text{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta - \left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi}\right)^2\right)}$$

IV. Deriving Acceleration from the First Principle and Plotting the Correlations: η

$$\eta == \frac{\sqrt{4\,\pi\left(\frac{2160\ c\ \sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{2160\ c\ \sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi} =$$

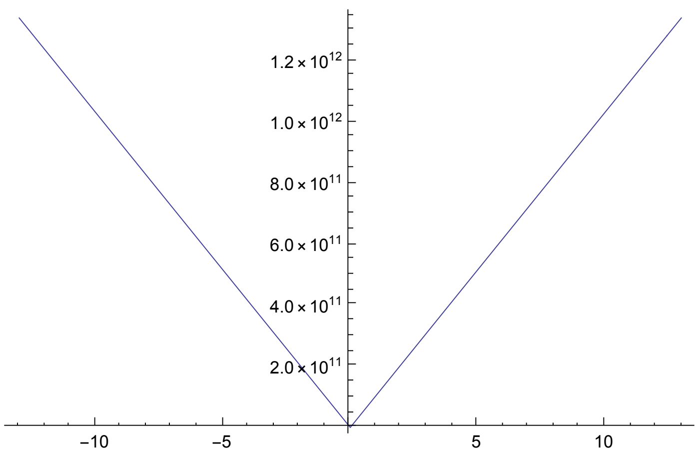
$$\frac{\sqrt{4\,\pi\left(\frac{1080\ c\ \sqrt{\theta}\ \sqrt{(4\,\pi-\theta)\,\theta}\ \mathrm{Csc}[\theta]}{\pi\ \sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{1080\ c\ \sqrt{\theta}\ \sqrt{(4\,\pi-\theta)\,\theta}\ \mathrm{Csc}[\theta]}{\pi\ \sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi} =$$

$$\frac{\sqrt{4\,\pi\left(\frac{2\,\pi\,r\,\mathrm{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta-\left(\frac{2\,\pi\,r\,\mathrm{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta^2}}{2\,\pi}$$

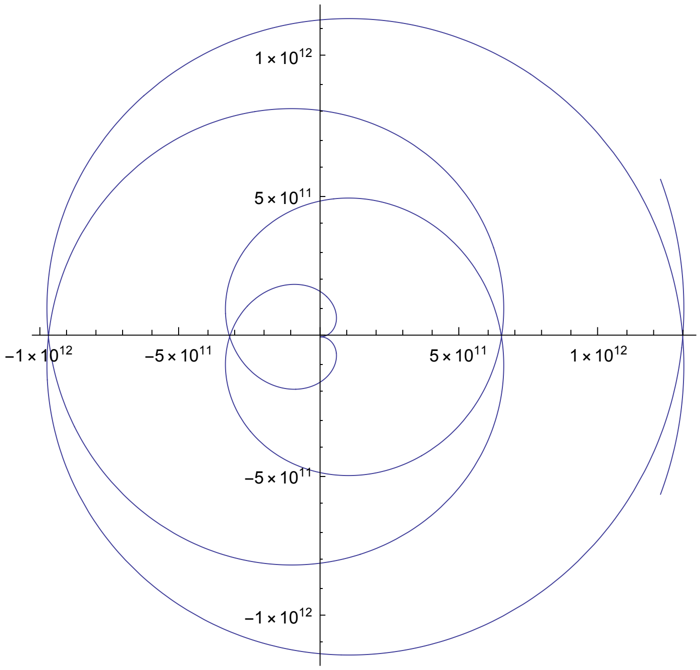
The following will be divided into actual expressions for η of each different possible perspective that I have thought of up to date.

Expression for η No. 1

$$\mathrm{Plot}\left[\frac{\sqrt{4\,\pi\left(\frac{2160\ c\ \sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{2160\ c\ \sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi},\ \{\theta,\ -13,\ 13\}\right]$$



$$\text{PolarPlot}\left[\frac{\sqrt{4\,\pi\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi},\ \{\theta,\,-13,\,13\}\right]$$



```
c := (2.99792458 * 10^8)
```

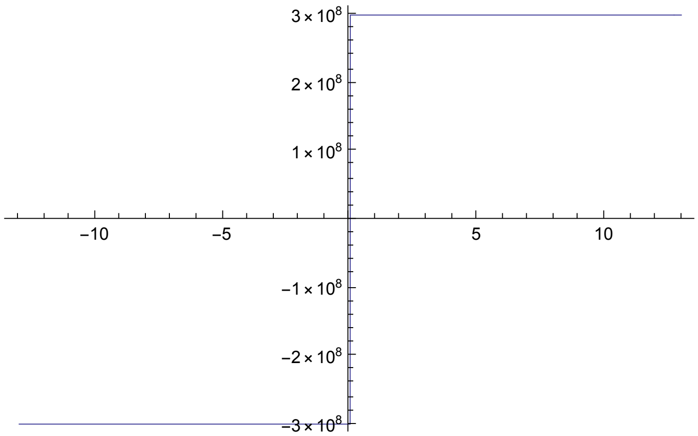
The first and second derivatives of expression for η No. 1

We are taking the derivative with respect to time, and since our time = $\tau = 6\,((180/\pi)\,\theta)$, we multiply by $1/(6\,(180/\pi))$, because only theta is changing, and theta is in terms of radians. For the physical conversions, we must take this factor out of the derivative with respect to time, because it is constant.

$$1\,/\,(6\,(180\,/\,\pi))\ D\left[\frac{\sqrt{4\,\pi\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi},\ \theta\right]$$

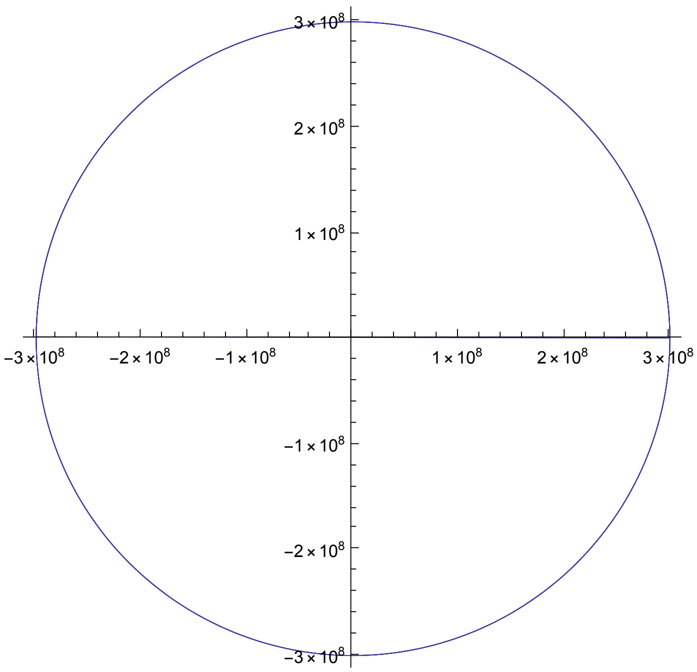
$$\frac{\frac{37\,324\,800\,c^2\,\pi\,\theta}{4\,\pi-\theta}+\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{(4\,\pi-\theta)^2}-\frac{13\,996\,800\,c^2\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{(4\,\pi-\theta)^2}}{4320\,\sqrt{\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{4\,\pi-\theta}}}$$

$$\texttt{Plot}\left[\frac{\frac{37\,324\,800\,c^2\,\pi\,\theta}{4\,\pi-\theta}+\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{(4\,\pi-\theta)^2}-\frac{13\,996\,800\,c^2\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{(4\,\pi-\theta)^2}}{4320\,\sqrt{\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{4\,\pi-\theta}}},\ \{\theta,\ -13,\ 13\}\right]$$



Light has a constant velocity.

$$\texttt{PolarPlot}\left[\frac{\frac{37\,324\,800\,c^2\,\pi\,\theta}{4\,\pi-\theta}+\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{(4\,\pi-\theta)^2}-\frac{13\,996\,800\,c^2\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{(4\,\pi-\theta)^2}}{4320\,\sqrt{\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{4\,\pi-\theta}}},\ \{\theta,\ -13,\ 13\}\right]$$



Light travels through its a distance equal to the height of the cone, with a max value of the initial radius, in a perfect circle in polar coordinates.

$$1 / (6\,(180 / \pi))\, D\left[\frac{\frac{37\,324\,800\,c^2\,\pi\,\theta}{4\,\pi-\theta}+\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{(4\,\pi-\theta)^2}-\frac{13\,996\,800\,c^2\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{(4\,\pi-\theta)^2}}{4320\,\sqrt{\frac{18\,662\,400\,c^2\,\pi\,\theta^2}{4\,\pi-\theta}-\frac{4\,665\,600\,c^2\,\theta^3}{4\,\pi-\theta}}},\,\theta\right]$$

This is one of the most fundamentally interesting graphs I have ever found. What is unseen in the printed version is that when you scroll down the page in mathematica, you see that a line moves across the graph and the graph actually changes just from scrolling.

We also notice that we can exchange locations of the expressions for r. This gives us different perspectives on what is going on when a body is accelerating through such a space that is defined by traveling

at the speed of light for a certain amount of time within the paremters of our system.

On Formulations of Pythagorean Theorem

by Parker Emmerson

Why this can help us prove string theory? Within even the smallest unit of time, there is an implied ten dimensionality. Because it is mathematically proven, it is no longer theoretical. The mathematics is directly correlated to the perceptual experience just as the geometer measures as he perceives.

Preface :

$$r^2 = \eta^2 + r_1^2$$

$$\theta r = 2\pi r - 2\pi r_1 = 2\pi r - 2\pi \sqrt{(r^2 - \eta^2)}$$

$$\theta r - 2\pi r = -2\pi \sqrt{(r^2 - \eta^2)}$$

$$\frac{\theta r - 2\pi r}{2\pi} = \sqrt{(r^2 - \eta^2)}$$

$$\left(\frac{\theta r - 2\pi r}{2\pi}\right)^2 = (r^2 - \eta^2)$$

$$\left(\frac{\theta r - 2\pi r}{2\pi}\right)^2 + \eta^2 = r^2 = \eta^2 + r_1^2$$

Relevant Lemmas to the Formulation

Lemma 4 *The height of the cone can be calculated in terms of only r and* θ, thus β is a function of θ alone.

Proof. Since we have shown that $\theta r = 2\pi r - 2\pi r_1$ and $r_1 \to \sqrt{r^2 - \eta^2}$, we can substitute the expression for r_1, calculated from the Pythagorean theorem in terms of the height of the cone and the initial radius of the circle, into the expression for θr in terms of the change in circumference of the initial circle to the circle, which is the base of the cone. $\theta r = 2\pi r - 2\pi \sqrt{(r^2 - \eta^2)}$, thus, $\eta = \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}$ = (r Sin[β]). From $\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}$ = r, we note that r = $\frac{2\pi r \,\mathrm{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}}$, so

$\theta = 2\left(\pi \pm \sqrt{\pi^2 - \pi^2 \,\mathrm{Sin}[\beta]^2}\right) = \frac{2\pi\left(r^2 + \sqrt{r^4 - r^2\eta^2}\right)}{r^2}$, because $1 = \frac{2\pi \,\mathrm{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}}$

Lemma 6 *The height of the cone can be calculated in terms of only r and* θ, thus θ is a function of β alone, and the initial radius can be calculated purely in terms of the angle θ.

$$\beta = \mathrm{ArcSin}\left[\frac{\sqrt{(4\pi - \theta)\,\theta}}{2\pi}\right]$$

$$\mathrm{Sin}[\beta] = \frac{\eta}{r} = \frac{\sqrt{4\pi r^2 \theta - r^2\theta^2}}{r\, 2\pi} = \frac{4\pi r^2\theta - r^2\theta^2}{4\pi^2 r} = \frac{r\,(4\pi - \theta)\,\theta}{4\pi^2}$$

$$\beta \to \mathrm{ArcSin}\left[\frac{4\pi r\theta - r\theta^2}{4\pi^2}\right] = \mathrm{ArcSin}\left[\frac{\sqrt{(4\pi - \theta)\,\theta}}{2\pi}\right]$$

$$\mathrm{Solve}\left[\mathrm{ArcSin}\left[\frac{4\pi r\theta - r\theta^2}{4\pi^2}\right] == \mathrm{ArcSin}\left[\frac{\sqrt{(4\pi - \theta)\,\theta}}{2\pi}\right], r\right]$$

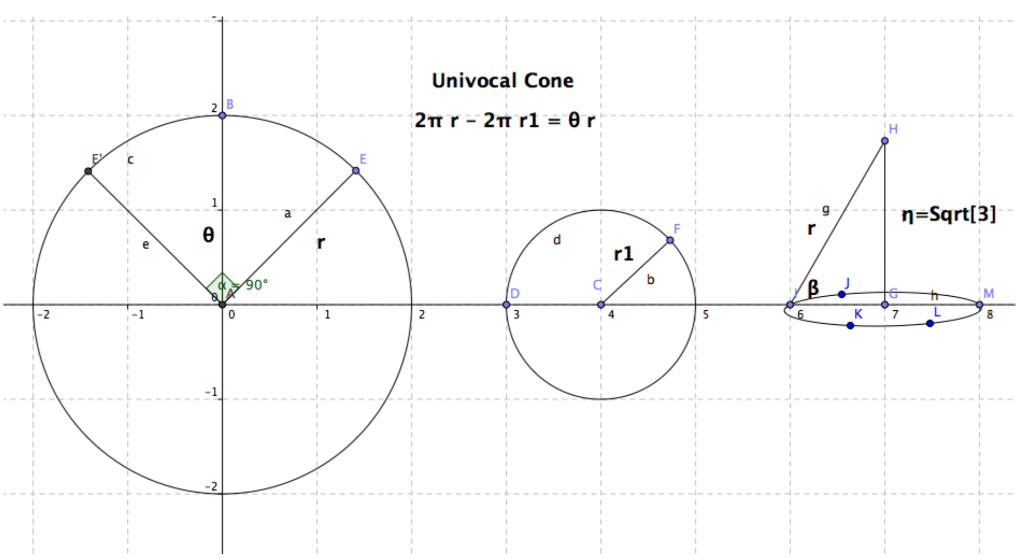
8 Roots symbolize the eight - fold path.

Parker' s Commentary on Fermat' s Last Theorem



Please see The Geometric Pattern of Perception to reference the preliminary investigations.

Lemma 5 *The height of the cone can be calculated in terms of only r and* θ, thus θ is a function of β alone.

Proof. Since we have shown that $\theta\, r = 2\,\pi\, r - 2\,\pi\, r_1$ and $r_1 \to \sqrt{r^2 - \eta^2}$, we can substitute the expression for r_1, calculated from the Pythagorean theorem in terms of the height of the cone and the initial

radius of the circle, into the expression for θ r in terms of the change in circumference of the initial circle to the circle that is the base of the cone into which the circle was transformed.

$\theta r = 2\pi r - 2\pi\sqrt{(r^2 - \eta^2)}$, thus, $\eta = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}$ = (r Sin[β]). From $\frac{2\pi\eta}{\sqrt{4\pi\theta-\theta^2}}$ = r, we note that: r = $\frac{2\pi r\,\text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}}$. So we solve the equation,

$$\text{Solve}\left[r == \frac{2\pi r\,\text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}},\ \theta\right]$$

$$\left\{\left\{\theta \to 2\left(\pi - \sqrt{\pi^2 - \pi^2\,\text{Sin}[\beta]^2}\right)\right\},\ \left\{\theta \to 2\left(\pi + \sqrt{\pi^2 - \pi^2\,\text{Sin}[\beta]^2}\right)\right\}\right\}$$

$$1 = \frac{2\pi\,\text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}}$$

The Meaning of n > 2 is n > $\frac{r\,\theta}{\pi\,(r - r_1)}$;

$$n > \frac{2\pi\,\text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}} + \frac{2\pi\,\text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}} >$$

$$\frac{\frac{r\,\theta}{\pi\,(r-r_1)}\,\pi\,\text{Sin}[\beta]}{\sqrt{\left(\frac{r\,\theta}{\pi\,(r-r_1)} + \frac{r\,\theta}{\pi\,(r-r_1)}\right)\pi\,\theta - \theta^2}} + \frac{\frac{r\,\theta}{\pi\,(r-r_1)}\,\pi\,\text{Sin}[\beta]}{\sqrt{\left(\frac{r\,\theta}{\pi\,(r-r_1)} + \frac{r\,\theta}{\pi\,(r-r_1)}\right)\pi\,\theta - \theta^2}}$$

x^n + y^n == z^n, where n > 2

$\theta r = 2\pi r - 2\pi r_1$

What is 2?

$$\text{Solve}[\theta r == \varrho\pi r - \varrho\pi r_1,\ \varrho]$$

$$\left\{\left\{\varrho \to \frac{r\,\theta}{\pi\,(r - r_1)}\right\}\right\}$$

$$2 == \frac{r\,\theta}{\pi\,(r - r_1)}$$

$$x\,\hat{}\,n + y\,\hat{}\,n == z\,\hat{}\,n, \text{ where } n > \frac{r\,\theta}{\pi\,(r - r_1)}$$

Form and Formality (Gibson - Stillwell - Emmerson Formulation of Fermat's Last Theorem)

It is important to note that it is an area of the retina that is affected by radiant energy, not just a single point. Gibson’s reason for believing that the geometry of transformations is important to visual

perception is that, “transformations are usually represented on a plane, however, whereas the retinal image is a projection on a curved surface,” (The Visual World, 153) **(Gibson, James, J.. The Perception of the Visual World. Cambridge, Mass.: The Riverside Press, 1950. Print. (All further references to this source will be cited parenthetically in the text)**.), and that, “the actual retinal image on a curved surface is related to the hypothetical image on a picture-plane only by such a non-rigid transformation” (The Visual World, 153). A transformation in geometry is the mapping of one point onto another. Isometries, “are defined as the transformations that preserve distance” (The Four Pillars of Geometry, 145) **(Stillwell, John. The Four Pillars of Geometry (Undergraduate Texts in Mathematics). 1 ed. New York: Springer, 2005. Print.)**. In essence, the distance of the initial radius is preserved through the transformation of a circle into a cone so long as the height is orthogonal to the base of the cone and the initial radius is always the slant of the cone. Next, we see the diagram to which Gibson was referring when considering the notion of a transformation onto a picture plane.

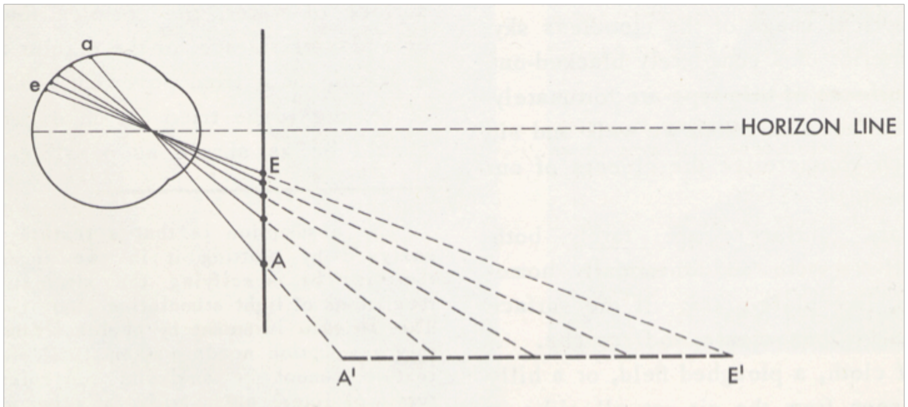

FIGURE 28. A Picture-Gradient, its Retinal Gradient, and the Longitudinal Surface Corresponding to Both

(The Visual World, 79).

In being preserved, the initial radius is considered an invariant. Stillwell comments about the picture plane that, “the line from (-1, 1) to (n, 0) crosses the y-axis at y = n/(n+1)” (The Four Pillars of Geometry, 91). This supposes that the eye is approximated like a point and that it is at the position of (-1, 1) in the Cartesian coordinate system. In the “coordinate system” described by The Geometric Pattern of Perception Theorems (Emmerson, 2009), the y-axis in general is described by the height of a cone. In relation to this diagram, in terms of the y intercept, the height of the cone would be changing with respect to both the initial radius (slant of the cone) and the angle taken out of the initial circle (the angle made between the line from the eye to the x-axis changes is a function of solely the angular amount taken out of the initial circle). Further mathematical analysis of optical infinity with relation to the horizon line and geometric system is needed, but perceived difference in circumferences as an arc length will be a useful formula. Gibson says that, “only because light is structured by the substantial environment can it contain information about it” (Ecological Approach, 86). The basic equation for an arc length as a difference in circumferences describes an even surface layout. Thus, for even surfaces, the equation that delivers that surface may be used as a linguistic device (in combination with rotation, or specifying the “adumbration” of the viewed surface) for describing the structuring of the light in the environment relevant to the perception of even surface layout. The expression for “phenomenal

velocity" tells us "how" motion in general is essentially structured, thus this includes the motion of light. However, this still needs specific interpretation.

From Stillwell ' s statement,
y = n / (n + 1) . From The Geometric Pattern of Perception (Emmerson, 2009),
$$\eta = \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi} \tag{240}$$

$$\text{Solve}\left[\left\{\frac{2\pi r - r\theta}{2\pi}\text{^}n + \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\text{^}n == r\text{^}n,\ n > 2\right\},\ \{\theta\}\right]$$

$$\text{Solve}\left[\left\{(2\pi)^{-n}\,(2\pi r - r\theta)^n + (2\pi)^{-n}\left(4\pi r^2\theta - r^2\theta^2\right)^{n/2} == r^n,\ n > 2\right\},\ \{\theta\}\right]$$

$$\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi} = n / (n+1) \tag{241}$$

$$\text{Solve}\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi} == n / (n+1),\ n\right]$$

$$\left\{\left\{n \to \frac{\sqrt{r^2\,(4\pi - \theta)\,\theta}}{2\pi - \sqrt{r^2\,(4\pi - \theta)\,\theta}}\right\}\right\} \tag{242}$$

$$\text{Solve}\left[2 == \frac{\sqrt{r^2\,(4\pi - \theta)\,\theta}}{2\pi - \sqrt{r^2\,(4\pi - \theta)\,\theta}},\ r\right]$$

$$\left\{\left\{r \to -\frac{4\pi}{3\sqrt{4\pi\theta - \theta^2}}\right\},\ \left\{r \to \frac{4\pi}{3\sqrt{4\pi\theta - \theta^2}}\right\}\right\}$$

Therefore, $r > \frac{4\pi}{3\sqrt{4\pi\theta - \theta^2}}$, and $\theta > \frac{2\pi\left(3r^2 + \sqrt{-4r^2 + 9r^4}\right)}{3r^2}$

$$x\text{^}n + y\text{^}n = z\text{^}n = \frac{2\pi r - r\theta}{2\pi}\text{^}n + \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\text{^}n == r\text{^}n == \text{Indeterminate} == \text{Indeterminate} \tag{243}$$

Indeterminate indeed equals an indeterminate, but where and how? There are still other configurations that may lead to trying to solve for a complex infinity. Complex infinity has specific geometric expression available in *The Geometric Pattern of Perception (Emmerson, 2009).*

Algebraic, Geometric Interpretations of the Uncertainty Principle

by Parker Emmerson

My goal in this paper is to introspect into the visualization of the uncertainty principle for differences between "transcendental-phenomenological" velocity and derivative velocity. Some of our fundamental equations are:

$h \approx \Delta x \Delta p = (2\pi r - 2\pi x)(m_1 v_1 - m_2 v_2)$ discovered by Heisenberg.

If mass is constant, then we can factor out mass.

$h \approx \Delta x \Delta p = (2\pi r - 2\pi x)\, m\, (v_1 - v_2)$

h := 6.6260695729 × 10 - 34 J * s

c := 2.99792458 (10^8) m / s

c := 2.99792458 (10^8)

In order to construct the correct expression for the velocity that is equal to the derivative of the height of the cone with respect to time, we must first calculate the angle related to the arc length taken out of the initial circle in terms of the phenomenological velocity.

$$\mathrm{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{(v)^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{(v)^2}{c^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == r\,\mathrm{Sin}[\beta],\ v\right]$$

$$\left\{\left\{v \to -\frac{1.\ \sqrt{-1.12941\times 10^{18}\,\theta + 8.98755\times 10^{16}\,\theta^2 + 3.54814\times 10^{18}\,\mathrm{Sin}[\beta]^2}}{\sqrt{-12.5664\,\theta + \theta^2 + 39.4784\,\mathrm{Sin}[\beta]^2}}\right\},\right.$$

$$\left.\left\{v \to \frac{\sqrt{-1.12941\times 10^{18}\,\theta + 8.98755\times 10^{16}\,\theta^2 + 3.54814\times 10^{18}\,\mathrm{Sin}[\beta]^2}}{\sqrt{-12.5664\,\theta + \theta^2 + 39.4784\,\mathrm{Sin}[\beta]^2}}\right\}\right\}$$

We will look at both the case of $v_2 = \left(\sqrt{}\left(-1.12941\times 10^{18}\,\theta + 8.98755\times 10^{16}\,\theta^2 + 3.54814\times 10^{18}\,\mathrm{Sin}[\beta]^2\right)\right) \Big/ \left(\sqrt{-12.5664\,\theta + \theta^2 + 39.4784\,\mathrm{Sin}[\beta]^2}\right)$

and

$v_1 = \left(\sqrt{}\left(-1.12941\times 10^{18}\,\theta + 8.98755\times 10^{16}\,\theta^2 + 3.54814\times 10^{18}\,\mathrm{Sin}[\beta]^2\right)\right) \Big/$

$$\left(\sqrt{-12.5664\,\theta + \theta^2 + 39.4784\,\mathrm{Sin}[\beta]^2}\right)$$

we will look at both the case of $v_1 =$

$$D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, t\right] \text{ and } v_2 = D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, t\right]$$

$$\mathbf{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{(v)^2}{c^2}}}\sqrt{\frac{\theta}{\sqrt{1-\frac{(v)^2}{c^2}}}}\sqrt{4\pi r - r\theta}}{2\pi} == r\,\mathrm{Sin}[\beta], \theta\right]$$

$$\left\{\left\{\theta \to \frac{1}{-8.98755\times10^{16}+v^2} 0.5\left(-1.12941\times10^{18}+12.5664\,v^2-1.\sqrt{\left(\left(1.12941\times10^{18}-12.5664\,v^2\right)^2 - 4.\left(-8.98755\times10^{16}+v^2\right)\left(-3.54814\times10^{18}+39.4784\,v^2\right)\mathrm{Sin}[\beta]^2\right)}\right)\right\}, \left\{\theta \to \frac{1}{-8.98755\times10^{16}+v^2} 0.5\left(-1.12941\times10^{18}+12.5664\,v^2+\sqrt{\left(\left(1.12941\times10^{18}-12.5664\,v^2\right)^2 - 4.\left(-8.98755\times10^{16}+v^2\right)\left(-3.54814\times10^{18}+39.4784\,v^2\right)\mathrm{Sin}[\beta]^2\right)}\right)\right\}\right\}$$

We then have the option of setting the velocity equal to either the radius divided by time or the height divided by time. We then solve for the time. I will do this for both the height divided by time and the radius of the initial circle divided by time.

v := r / t

$$\beta := \mathrm{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}\right]$$

$$\text{Solve}\Big[\theta == \frac{1}{-8.987551787368176`*^16 + v^2} 0.5` \Big(-1.1294090667581471`*^18 + 12.566370614359172` v^2 + \sqrt{\Big(\big(1.1294090667581471`*^18 - 12.566370614359172` v^2\big)^2 - 4.` \big(-8.987551787368176`*^16 + v^2\big) \big(-3.5481432270250993`*^18 + 39.47841760435743` v^2\big) \text{Sin}[\beta]^2\Big)}\Big), \theta\Big]$$

The Paradox of Time and Cyclicality by Parker Emmerson

$\theta = 2\pi * \text{time} = 2\pi t$

Please refer to the work entitled Math for Transforming a Circle into a cone if questions are raised of proof.

From this, we can mathematically prove that if time is measured like a clock by the cyclically passing angle, there is by definition no time. That is time = 0, yet time does have contiuous expressions and solutions.

$2\pi r - 2\pi r_1 = \theta r = 2\pi r - 2\pi (r \cos[\beta])$

On the Processing of Tachyon Emulsion from a Photon' s Energy

by Parker Emmerson

In the name of Allah, the following mathematics is invoked, may there be truth to it. Irony from the combination of two unlike things is the meaning of the act of emulsion.

I recommend further studies into the realm of complex infinity including systems that can account for counting from infinity like we count from zero.

These are theoretical models that suppose that the velocity of a tachyon is positive as well as the

velocity of a regular particle.

Velocity of a Photon's Geometry

Only when the exact speed of light, or an extremely close approximation is used during the solution of these equations are any solutions able to be found. If I use a variable c, the equation cancels out. Only when designating c to be numerically the exact value of light or close to it can the equation be solved for the innate velocity.

```
c := 2.99792458
```

Right now, mathematics does a better job of describing the visual world than a photo. We are looking for a way of expressing what we see in terms of actual texture and depth, so why not use mathematics? Paint peeling of a wall has a certain visual texture that does not come across very well in a photograph or video. For some reason, mathematics can describe an entire object of perception.

This is extremely useful in processing the information emulsed by a photon onto a tachyon, because it has the same form as the relativistic height of the cone for regular particle traveling. These forms may be interchanged, allowing information of the same kind to pass through one form of the equation, while being expressed only in that form when the tachyon has the information transformed into it.

Frequency of a Tachyon

f = frequency

Theory on the Process of Tachyon Emulsion

In this paper, I will outline a few of the possibilities for transferring information contained within light via frequency, patterns, and digital signals to tachyons traveling faster than light. First, we set up the equation for the energy of a tachyon.

The term emulsion is used to describe this, because it is similar to the mixing of two things that are unblendable. Light energy cannot travel faster than light, and tachyon energy must always travel faster than light. We are trying to imprint the information of the energy of light into the information in the energy of a tachyon, which is traveling faster than light. Information, traveling at the speed of light, impresses itself onto the tachyon, and then the tachyon transfers that information at faster than light speed.

E = (z c^2) / $\sqrt{(u^2/c^2) - 1}$, where E is energy, z is imaginary mass, c is the speed of light, and u is the velocity of the mass.

Then, we note that z is imaginary mass, defining it to be :

Non - tachyon, or regular energy is equal to
E = (m c^2) / $\sqrt{1 - v^2/c^2}$

(z c^2) / $\sqrt{(u^2/c^2) - 1}$ = (m c^2) / $\sqrt{1 - v^2/c^2}$ = h ν

```
c := (2.99792458 * 10^8)
```

`h := 6.626068 * 10 ^ - 34`

`z := ⅈ m`

We then set up a relativistic equation where we can solve for the intrinsic velocity of a wavelength of light.

From a difference in circumferences applied to the Pythagorean Theorem it can be shown that : Solve$\left[\frac{\sqrt{r\sqrt{1-\frac{(v)^2}{c^2}}}\sqrt{\frac{\theta}{\sqrt{1-\frac{(v)^2}{c^2}}}}\sqrt{4\pi r - r\theta}}{2\pi} == r\,\mathrm{Sin}[\beta],\ v\right]$

$$\left\{\left\{v \to -\left(1.\grave{}\ \sqrt{\left(-1.1294090667581471\grave{}*^{\wedge}18\,\theta + 8.987551787368176\grave{}*^{\wedge}16\,\theta^2 + 3.5481432270250993\grave{}*^{\wedge}18\,\mathrm{Sin}[\beta]^2\right)}\right)\Big/\left(\sqrt{-12.566370614359172\grave{}\ \theta + \theta^2 + 39.47841760435743\grave{}\ \mathrm{Sin}[\beta]^2}\right)\right\},\right.$$
$$\left.\left\{v \to \left(\sqrt{\left(-1.1294090667581471\grave{}*^{\wedge}18\,\theta + 8.987551787368176\grave{}*^{\wedge}16\,\theta^2 + 3.5481432270250993\grave{}*^{\wedge}18\,\mathrm{Sin}[\beta]^2\right)}\right)\Big/\left(\sqrt{-12.566370614359172\grave{}\ \theta + \theta^2 + 39.47841760435743\grave{}\ \mathrm{Sin}[\beta]^2}\right)\right\}\right\}$$

because the equation rearranges to :

Solve$\left[r\left(1-\frac{(v)^2}{c^2}\right)\theta\,4\pi r == (2\pi r\,\mathrm{Sin}[\beta])^{\wedge}2 + r\theta\sqrt{1-\frac{(v)^2}{c^2}},\ v\right]$,

yielding even more solutions.

We will use the mathematica generated positive solution,

$$v := \left(\sqrt{\left(-1.1294090667581471\grave{}*^{\wedge}18\,\theta + 8.987551787368176\grave{}*^{\wedge}16\,\theta^2 + 3.5481432270250993\grave{}*^{\wedge}18\,\mathrm{Sin}[\beta]^2\right)}\right)\Big/\left(\sqrt{-12.566370614359172\grave{}\ \theta + \theta^2 + 39.47841760435743\grave{}\ \mathrm{Sin}[\beta]^2}\right)$$

$E = m\,c^{\wedge}2 = h\,\nu$

$v = \lambda\,\nu = \eta\,\nu$

We solve for the

$$\mathrm{Solve}\left[\left(\sqrt{\left(-1.1294090667581471\grave{}*^{\wedge}18\,\theta + 8.987551787368176\grave{}*^{\wedge}16\,\theta^2 + 3.5481432270250993\grave{}*^{\wedge}18\,\mathrm{Sin}[\beta]^2\right)}\right)\Big/\left(\sqrt{-12.566370614359172\grave{}\ \theta + \theta^2 + 39.47841760435743\grave{}\ \mathrm{Sin}[\beta]^2}\right) == \eta\,\nu,\ \nu\right]$$

$$\nu = \text{Solve}\left[(1/(\theta/2\pi)) == \left(1.\grave{}\ \sqrt{\left(-1.1294090667581471\grave{}*\hat{}18\,\theta + 8.987551787368176\grave{}*\hat{}16\,\theta^2 + 3.5481432270250993\grave{}*\hat{}18\,\text{Sin}[\beta]^2\right)}\right) \Big/ \left(\eta\,\sqrt{-12.566370614359172\grave{}\,\theta + \theta^2 + 39.47841760435743\grave{}\,\text{Sin}[\beta]^2}\right), \eta\right]$$

$$v = \left(\sqrt{\left(-1.1294090667581471\grave{}*\hat{}18\,\theta + 8.987551787368176\grave{}*\hat{}16\,\theta^2 + 3.5481432270250993\grave{}*\hat{}18\,\text{Sin}[\beta]^2\right)}\right) \Big/ \left(\sqrt{-12.566370614359172\grave{}\,\theta + \theta^2 + 39.47841760435743\grave{}\,\text{Sin}[\beta]^2}\right) = \eta\,\nu = \eta\,(1/(\theta/(2\pi)))$$

So, I pull together the equation for Energy of a photon from the geometry of a transformation of a circle into a cone, and then I set that equal to the energy of of the tachyon, because the geometry necessitates that something traveling at constant velocity (light) is at the thirty - sixty - ninety triangle position within the cone formed by the Pythagorean theorem applied to the change in circumferences of two circles, however positions below the 30 - 60 - 90 triangle exist, but necessitate acceleration. The geometry of time, or cyclicality, defines the velocity through the aforementioned transformation for positions above and below the 30 - 60 - 90 position of the cone. The innate geometry of the ontology of spacetime specifies both positive and negative solutions to the time element.

$$E = h\,(1/(\theta/2\pi))$$

$$E = m\,c\hat{}2 = h\,\nu = (z\,c\hat{}2) \Big/ \sqrt{(u\hat{}2/c\hat{}2) - 1} \text{ where } z = i\,m$$

$$h\,\nu = h\left(1.\grave{}\ \sqrt{\left(-1.1294090667581471\grave{}*\hat{}18\,\theta + 8.987551787368176\grave{}*\hat{}16\,\theta^2 + 3.5481432270250993\grave{}*\hat{}18\,\text{Sin}[\beta]^2\right)}\right) \Big/ \left(\eta\,\sqrt{-12.566370614359172\grave{}\,\theta + \theta^2 + 39.47841760435743\grave{}\,\text{Sin}[\beta]^2}\right) = h\,(1/(\theta/2\pi)) = (z\,c\hat{}2) \Big/ \sqrt{(u\hat{}2/c\hat{}2) - 1}$$

Solve[h (1.` √(-1.1294090667581471`*^18 θ + 8.987551787368176`*^16 θ^2 + 3.5481432270250993`*^18 Sin[β]^2)) / (η √(-12.566370614359172` θ + θ^2 + 39.47841760435743` Sin[β]^2)) == (z c^2) / √((u^2 / c^2) - 1), u]

$$\left\{\left\{u \to -4.76445\times10^{-8}\sqrt{\left(3.95928\times10^{31}+8.10486\times10^{114}\,z^2\,\eta^2-\frac{5.07954\times10^{16}\,\theta}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}+\frac{1.0261\times10^{99}\,z^2\,\eta^2\,\theta}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}+\frac{3.23424\times10^{15}\,\theta^2}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}-\frac{6.59759\times10^{97}\,z^2\,\eta^2\,\theta^2}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}\right)}\right\},\right.$$

$$\left.\left\{u \to 4.76445\times10^{-8}\sqrt{\left(3.95928\times10^{31}+8.10486\times10^{114}\,z^2\,\eta^2-\frac{5.07954\times10^{16}\,\theta}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}+\frac{1.0261\times10^{99}\,z^2\,\eta^2\,\theta}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}+\frac{3.23424\times10^{15}\,\theta^2}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}-\frac{6.59759\times10^{97}\,z^2\,\eta^2\,\theta^2}{12.5664\,\theta-1.\,\theta^2-39.4784\,\mathrm{Sin}[\beta]^2}\right)}\right\}\right\}$$

To get rid of z and have m in terms of the velocity, we solve the equation :

E = (m c^2) / √(1 - v^2 / c^2) = h ν, where v has been shown to equal :

v = (√(-1.1294090667581471`*^18 θ + 8.987551787368176`*^16 θ^2 + 3.5481432270250993`*^18 Sin[β]^2)) / (√(-12.566370614359172` θ + θ^2 + 39.47841760435743` Sin[β]^2))

and ν =

(1 / (θ / 2 π)) {{ν → (1.` √(-1.1294090667581471`*^18 θ + 8.987551787368176`*^16 θ^2 + 3.5481432270250993`*^18 Sin[β]^2)) / (η √(-12.566370614359172` θ + θ^2 + 39.47841760435743` Sin[β]^2))}}

Thus, we set up the equation :

```
(m c^2) / √(1 - (√(-1.1294090667581471`*^18 θ +
        8.987551787368176`*^16 θ^2 + 3.5481432270250993`*^18 Sin[β]^2)) /
      (√(-12.566370614359172` θ + θ^2 + 39.47841760435743` Sin[β]^2))^2 / c^2) =
  h (1 / (θ / 2 π)) = h (1.` √(-1.1294090667581471`*^18 θ +
        8.987551787368176`*^16 θ^2 + 3.5481432270250993`*^18 Sin[β]^2)) /
    (η √(-12.566370614359172` θ + θ^2 + 39.47841760435743` Sin[β]^2)), and solve for m
```

```
Solve[(m c^2) / √(1 - (√(-1.1294090667581471`*^18 θ +
          8.987551787368176`*^16 θ^2 + 3.5481432270250993`*^18 Sin[β]^2)) /
        (√(-12.566370614359172` θ + θ^2 + 39.47841760435743` Sin[β]^2))^2 / c^2) ==
   h (1.` √(-1.1294090667581471`*^18 θ + 8.987551787368176`*^16 θ^2 +
          3.5481432270250993`*^18 Sin[β]^2)) /
     (η √(-12.566370614359172` θ + θ^2 + 39.47841760435743` Sin[β]^2)), m]
```

$$\left\{\left\{m \to \left(7.37249 \times 10^{-51} \sqrt{-1.12941 \times 10^{18}\, \theta + 8.98755 \times 10^{16}\, \theta^2 + 3.54814 \times 10^{18}\, \text{Sin}[\beta]^2}\; \sqrt{\left(1. - \left(1.11265 \times 10^{-17} \sqrt{\left(-1.12941 \times 10^{18}\, \theta + 8.98755 \times 10^{16}\, \theta^2 + 3.54814 \times 10^{18}\, \text{Sin}[\beta]^2\right)}\right) \middle/ \left(-12.5664\, \theta + \theta^2 + 39.4784\, \text{Sin}[\beta]^2\right)\right)}\right) \middle/ \left(\eta \sqrt{-12.5664\, \theta + \theta^2 + 39.4784\, \text{Sin}[\beta]^2}\right)\right\}\right\}$$

```
Solve[(m c^2) / √(1 - (√(-1.1294090667581471`*^18 θ +
